Shellfish systematics is the most unique one in Fisheries Science in view of its importance and implications in diversity. The systematic zoology is the science that discovers names, determines relationships, classifies and studies the evolution of living organisms. It is an important branch in biology and is considered to be one of the major subdivisions of biology having a broader base than genetics, biochemistry and physiology. The shellfish includes two highly diversified phyla i.e. phylum *Arthropoda* and phylum *Mollusca*. These two groups are named as shellfishes because of the presence of exoskeleton made of chitin in arthropods and shells made of calcium in molluscs. These two major phyla are invertebrates. They show enormous diversity in their morphology, in the habitats they occupy and in their biology. *Phylum Arthropoda* includes economically important groups such as lobsters, shrimps, crabs. Taxonomical study reveals numerous interesting phenomena in shellfish phylogeny and the study is most indispensable for the correct identification of candidate species for conservation and management of our fishery resources and aquaculture practices. On the whole taxonomic study on shellfishes furnishes the urgently needed information about species and it cultivates a way of thinking and approaching of all biological problems, which are much needed for the balance and well being of shellfish biology as a whole.

Shrimp resources are available both from inshore and from offshore waters. As the fish resource from inshore waters remained static during the last two decades, fishing pattern underwent several changes in the previous decade, leading to the exploitation of deep sea resources either with deployment of large sized vessels or modified medium/small sized vessels. Deepwater shrimps appear to have a world-wide distribution in tropical waters. They have been caught in surveys using baited traps in depths between 200 m and 800 m off continents and at 200-500 m depth in the Indian Ocean.

Deep sea decapod crustaceans constitute one of the dominant high price groups of invertebrates in the marine fishery sector of Kerala although the structure and organization of their community are not well known as that of coastal penaeid prawns. In view of the increasingly prominent role played by deep sea prawns and prawn products in the economy of the country, the taxonomic identity of various species exploited from the deep sea fishing grounds off Kerala is an essential prerequisite for the sustainable development and management of deep sea prawn wealth of Kerala. The deep sea prawns landed at various harbours of Kerala is an assemblage of wide array of species representing various families, the prominent being *Pandalidae, Aristeidae, Solenoceridae* and *Penaeidae* while family *Oplophoridae* contributes to only a minor portion of the deep sea trawl catches in Kerala.

**Difference between penaeid and non penaeid shrimps**

Penaeid shrimp

- Abdomen with posterior part of pleura covering anterior part of succeeding pleura.
- Thelycum and petasma present, eggs are released directly
Taxonomy, Biology and distribution of Deep sea shrimps

Caridean shrimp

- 2nd abdominal pleuron greatly expanded, pear shaped and overlapping posterior part of 1st pleuron and anterior part of 3rd pleuron.
- No specific copulatory organs, females carry eggs on the abdomen until hatching

Pandalidae

1. Carapace hard and rigid with longitudinal carinae; 2nd pair of pereiopods unequal. *Heterocarpus* ... 3
   Carapace smooth without a longitudinal carinae; 2nd pair of pereiopods Carapace equal ... 2
2. 3rd abdominal somite unarmed or with fixed postero-medial tooth; terminal segment of 2nd maxilliped broader than long, attached strip like to penultimate segment

Key to the deepsea prawns of Penaeidae, Pandalidae and Oplophotidae

Penaeidae

1. Inner border of the antennular peduncle with a setose scale; Podaobranchiae absent 2
   No setose scale on the inner border of the antennular peduncle; podobranchiae present; pleurobranchia on 10-13 segments reduced to mere papillae ... *Aristeus alcocki*
2. Exopodite of the external maxillipeds large, absence of a brachio-cardiac sulcus in the branchiostegal region ... 3
3. Symmetrical petasma; no basal spine at 3rd maxilliped ... 4
4. A long fissure on either side of the carapace throughout the entire length; rostrum not glabrous and less then 1/3rd the length of carapace ... *Parapenaeus investigatoris*
   No fissure on carapace wall; rostrum glabrous, as long as carapace ... *Penaeopsis jerryi*
5. Posterior 10 ventral rostral teeth corresponding to 8 or fewer dorsal teeth, penultimate segment of 3rd maxilliped usually less than 1.5 times as long as terminal segment ... *Plesionika quasigrandis*
   Posterior 10 ventral rostral teeth corresponding to more than 8 dorsal teeth, penultimate segment of 3rd maxilliped more than 1.5 times as long as terminal segment ... 6
6. Dactylus of 3rd pereiopod less than 1/7 times as long as propodus, posterior 10 ventral rostral teeth usually corresponding to more than 13 dorsal teeth ... *Plesionika spinipes*
   Dactylus of 3rd pereiopod more than 1/7 times as long as propodus, posterior 10 ventral rostral teeth usually corresponding to 13 or fewer dorsal teeth ... *Plesionika grandis*
7. Rostrum armed with a series of closely packed spines ventrally; distinct ocellus ... 8
   Rostrum armed with distantly placed spines; ocellus absent ... *Plesionika alcoki*
8. 3rd abdominal tergum posteriorly protrudes as a sharp

Pandalidae

1. Carapace hard and rigid with longitudinal carinae; 2nd pair of pereiopods unequal. *Heterocarpus* ... 3
   Carapace smooth without a longitudinal carinae; 2nd pair of pereiopods Carapace equal ... 2
2. 3rd abdominal somite unarmed or with fixed postero-medial tooth; terminal segment of 2nd maxilliped broader than long, attached strip like to penultimate segment

with its longer side ... *Plesionika* ... 5
3. 3rd abdominal tergum without spines, length of 6th abdominal segment less than 5th ... 4
   3rd abdominal tergum ends in a sharp spine dorsally; 6th segment more than double the length 5th ... *Heterocarpus woodmasoni*
4. Only one tooth present anterior to orbit; dorsal carapaceal ridge not prominent ... *Heterocarpus laevigatus*
   More than two teeth anterior to the orbit; dorsal carapaceal ridge very prominent ... *Heterocarpus gibbosus*
5. Posterior 10 ventral rostral teeth corresponding to 8 or fewer dorsal teeth, penultimate segment of 3rd maxilliped usually less than 1.5 times as long as terminal segment ... *Plesionika quasigrandis*
   Posterior 10 ventral rostral teeth corresponding to more than 8 dorsal teeth, penultimate segment of 3rd maxilliped more than 1.5 times as long as terminal segment ... 6
6. Dactylus of 3rd pereiopod less than 1/7 times as long as propodus, posterior 10 ventral rostral teeth usually corresponding to more than 13 dorsal teeth ... *Plesionika spinipes*
   Dactylus of 3rd pereiopod more than 1/7 times as long as propodus, posterior 10 ventral rostral teeth usually corresponding to 13 or fewer dorsal teeth ... *Plesionika grandis*
7. Rostrum armed with a series of closely packed spines ventrally; distinct ocellus ... 8
   Rostrum armed with distantly placed spines; ocellus absent ... *Plesionika alcoki*
8. 3rd abdominal tergum posteriorly protrudes as a sharp
dorsal spine… *Plesionika ensis*
3rd abdominal tergum without spines but protrudes as a wavy margin… *Plesionika martia*

**Oplophoridae**

1. Rostrum with atleast as many dorsal as ventral teeth; abdomen with 4th and 5th somites usually armed with posteromesial tooth; left mandible with incisor process not tapering sharply toward opposable margin, armed with 9-14 subacute teeth… *Acanthephyra*

2. Abdomen with 6th somite shorter than 5th (not including posteromesial spine); telson simply pointed posteriorly, not terminating in spinose endpiece; 3rd maxilliped and 1st pereiopod with broadly compressed rigid exopods… *Oplophorus*

3. Carapace without carina supporting branchiostegal spine; abdomen with posterior margin of 3rd somite distinctly excavate either side of posteriomedian tooth… *Acanthephyra armata*

Carapace with strong carina extending from branchiostegal spine to branchial region; abdomen with posterior margin of 3rd somite not distinctly excavate either side of posteriomedian tooth… *Acanthephyra fimbriata*

4. Abdomen with posteriomedian tooth on 4th and 5th somites; telson armed with four pairs of dorsolateral spines… *Acanthephyra sanguinea*

5. Rostrum distinctly overreaching antennal scale; posterior extension of upper lateral rostral carinae on carapace subparallel in dorsal aspect; pleuron of 1st abdominal somite armed with small tooth on ventral margin; antennal scale unarmed on only distal 1/6 of lateral margin… *Oplophorus gracilirostris*

Rostrum rarely overreaching antenna scale; posterior extension of upper lateral rostral carinae on carapace converging posteriorly in dorsal aspect; pleuron of 1st abdominal somite unarmed; antennal scale with distal ¼ of lateral margin unarmed… *Oplophorus typus*

**Aristeus alcocki** Ramadan 1938

Common name: Red ring

Family: Aristeidae

Diagnosis characters: Large size red abdominal rings.

**Fishery & biology:** The catches were mainly composed of females and their size ranged from 78 mm to 188 mm in total length. The size distribution showed unimodal pattern with majority in size groups 146-165 mm. The males, which were very poorly represented in the catches were relatively smaller in size and their total length varied from 67 mm to 110 mm.

**Distribution:** Indian Ocean; Arabian Sea and Bay of Bengal, at depth of 350-450 m off Quillon and Alleppey.

**Plesiopenaeus edwardsianus** Johnson, 1868

Scarlet shrimp

Family: Aristeidae

Diagnosis characters: Rostrum very long in females and young males but becoming considerably short in adult males, with three or more dorsal teeth; carapace without postorbital spine; eye stalks with a tubercle on inner border; upper antennular flagella very short and flattened almost throughout their length; endopods of second pair of pleopods in males bearing appendix masculine and appendix interna; third and fourth pairs of pleopods biramous; telson armed...
Taxonomy, Biology and distribution of Deep sea shrimps

with 1 or 4 movable spines on each side; two well developed arthrobranchs on penultimate thoracic segment.

**Colour:** Deep pink

**Fishery & biology:** Three female specimens ranging in total length from 207 to 245 mm (rostrum partly broken in all specimens) and carapace length from 79 to 96 mm obtained in Bobbin Trawl at 876-976 m depth.

**Distribution:** During one of the deep-sea trawling operations of FORV Sagar Sampada a few specimens of prawns, which were unusually large in size, were taken from about 900 m depth off Trivandrum on the southwest coast.

**Solenocera hextii** Wood-Mason & Alcock, 1891

Deep sea mud shrimp

**Family:** Solenoceridae

**Diagnostic characters:** Flattened rostrum with 7 teeth on dorsal side and no teeth on ventral side of the rostrum. Postrostral carina sharp but not laminose. Antennular flagella with red and white bands. The spines on the cervical groove situated ventral to the posteriormost rostral tooth which is well developed. The characteristic ‘L’ shaped groove on either side of the branchiostegal region is also clearly defined.

**Colour:** Pink to red

**Distribution:** Found all along the east and west coast of India at depths between 250 to 547 m.

**Solenocera alfonso** Perez Farfante, 1981

Deep water mud shrimp

**Diagnostic characters:** Antennular flagella flattened and tube like, rostrum horizontal, exopod of uropod without distolateral spine (family character). Telson armed with lateral spines; post rostral crest elevated but not plate like. The postrostral crest is not separated from postrostral teeth by a distinct notch but postrostral crest behind cervical groove sometimes with an upper tooth. Posterior part of hepatic groove and anterior part of branchiocardiac groove both very distinct and strongly curving downward; median part of first abdominal segment very narrow and dorsal crest of second abdominal segment distinct.

**Colour:** Pink to red

**Distribution:** Found at depths between 176 to 547 m. Though an Indo-West Pacific species, earlier records were only from Philippines, Indonesia and Northwestern Australia. In 2011, the species was recorded from Tuticorin, southeast coast of India from a depth of 250 to 350 m.

**Metapenaeopsis andamanensis** (Wood-Mason, 1891)

Rice velvet shrimp

**Family:** Penaeidae

**Diagnostic characters:** Rostrum more or less horizontal and straight with 6 to 7 teeth on dorsal side and no teeth on the ventral side. Lower antennular flagellum longer than the upper, much longer than the entire antennular peduncle but 0.7 times the carapace length. 3rd pereopod surpass
the rostrum by the length of the entire chela. Assymetrical petasma. 3rd maxilliped and 1st pereopod with a basal spine, distal fixed pair of spines on telson.

**Colour:** Pale pink to red

**Fishery & biology:** The total length of males varied from 67 mm to 115 mm and that of females from 68 mm to 130 mm.

**Distribution:** A penaeid prawn commonly encountered in the trawl catches at all depths ranges upto 400 m and was obtained from all areas.

**Penaeopsis jeryii**
Common name: Dagger shrimp
Family: Penaeidae

**Diagnostic characters:** Dagger shaped rostrum with teeth on dorsal side of the rostrum. Specimen appears to be pale red in color with white bands on the body. Cervical groove very prominent, antennal scale as long as rostrum. Thelycum trilobed and sub elliptical in structure.

**Fishery & biology:** Size range of female specimens ranged from 74-115 mm and males ranged from 70-110 mm.

**Distribution:** All along the southwest coast of India particularly off Cochin, Quillon and Alleppey at depth of 275-350 m

**Non-Penaeid shrimps**

**Heterocarpus woodmasoni Alcock, 1901**
Indian Nylon Shrimp
Family: Pandalidae

**Systematics**
- **Kingdom:** Animalia
- **Phylum:** Arthropoda
- **Subphylum:** Crustacea
- **Class:** Malacostraca
- **Subclass:** Eumalacostraca
- **Superorder:** Eucarida
- **Order:** Decapoda
- **Suborder:** Pleocyemata
- **Infraorder:** Caridea

**Diagnostic characters:** Carapace with 2 longitudinal crests on each side, extending over full length of carapace - post antennal crest and branchiostegal crest. A conspicuous elevated, sharp tooth at middle of dorsal crest of 3rd abdominal segment, telson bears 5 pairs of dorsolateral spinules besides those at the tip.
Taxonomy, Biology and distribution of Deep sea shrimps

**Fishery & biology:** Size in the catches ranged from 72 to 135 mm in total length but dominated by 111-120 mm size groups in both the sexes. The fertilized eggs on the pleopods and the head-roe are light orange and this colour stands out in contrast with the pink colour of the prawn. The berry becomes greyish in advanced stages of development.

**Distribution:** Andamans, Southwest of India off Cochin and Alleppey at depths of 250-400 m

*Heterocarpus gibbosus* Bate, 1888
Humpback nylon shrimp

**Fishery & biology:** The size of the individual prawn varied from 67 to 140 mm in total length and the catches were represented by all groups of the females. Males are mostly in 90-100 mm size groups. The colour of the berry is light orange and turns dirty grey as embryo develops.

**Distribution:** Southeast and Southwest coast off Cochin, off Alleppey at depths of 250-400 m. Immature specimens were found in greater numbers in shallow waters while the bigger prawns seemed to prefer deeper grounds beyond 350 m.

*Heterocarpus sibogae* de Man, 1917

**Diagnostic characters:** Integument tomentose formed by lanceolate scalelike spines, rostrum about 2/3 as long as carapace, gradually recurved upwards, armed dorsally with 8 teeth followed by 6 on postrostral crest of which the first one placed behind middle of two small ones situated closely on distal part; a dark reddish spot covering almost the entire width of 3rd abdominal somite on either side appears to be characteristic; tip of rostrum, orbital margin, carinae of 1st and 2nd abdominal terga, distal portion of spines on 3rd and 4th terga, tip of dorsal antennular flagellum and pereopods and the entire pleopods reddish; telson long, nearly as long as uropods, armed with 5 small dorsolateral movable spines on right side and 4 on left side in addition to 3 pairs at distal end; antennular flagella about the same length of carapace, styllocerite pointed and reaching middle of second segment of antennular peduncle; scaphocerite narrower distally, reaching 3/4 of rostrum; distolateral spine projecting well beyond anterior margin.

**Colour:** Fresh specimen appears pink

**Fishery:** One female, total length 114 mm, carapace length 34 mm; off Quilon at 310-320 m.

**Distribution:** Southeast and Southwest coast of India

*Plesionika spinipes* (Bate, 1888)
Oriental Narwal Shrimp
Pandalidae

**Diagnostic characters:** Rostrum upturned at the tip. Rostrum is armed with 46 teeth on the dorsal side and 31 teeth on antennal crest very short.

**Fishery & biology:** The teeth on the dorsal crest and the rostrum together vary from 8 to 10. Teeth on the rostrum proper varying from 2 to 4 and 13-15 on ventral side. The dactyli of the 3 posterior legs short, median carination of the 3rd abdominal tergum is quite prominent. Carapace with 2 longitudinal crests on each side, extending over full length of carapace- post-ocular crest and branchiostegal crest. Post
the ventral side, very long slender legs, Telson is double the length of the 5th abdominal somite. Lower antennular flagellum longer than the upper and about 5.4 times the carapace length. 3rd maxilliped extends beyond the antennal scale by the length of its dactylus. Second pereopod exceeds the tip of antennal scale by its chela and 1/8 length of carpus. Minute tubercle on the dorsal surface of the carapace at about 1/6th of its length from the hinder edge which corresponds in position to the small blunt median spine which is present in all the specimens.

**Colour:** Body pale red in colour

**Fishery & biology:** The size of this prawn in the catches ranged from 63 to 125 mm but the size groups 95-110 mm in both sexes predominated. Berry is greenish-blue in colour with ovoid shape of fertilized eggs.

**Distribution:** In Indian waters this species is known to occur in south-east and south-west coast of India abundantly noticed from Quilon and Mangalore regions from the depth of 250-400 m.

*Plesionika martia* (A. Milne-Edwards, 1883)

**Golden Shrimp**

**Diagnostic characters:** Rostrum very long pointed with 7-9 dorsal teeth including 2-5 teeth on carapace posterior to the level of orbital margin while ventral margin of the rostrum is armed with 34-56 teeth.

**Fishery & biology:** The size of this prawn in the catches ranged from 71 to 120 mm in males and 80 to 130 mm in females. The modal lengths for males and females were at 90-95 mm and 96-100 mm respectively. Berry is deep blue in colour in the early stages and to light grey in advances stages of development.

**Ophlophorus gracilirostris** Alcock, 1901

**Diagnostic characters:** Carapace with dorsal carina extending to the posterior margin. Rostrum very long almost equal in length to the carapace. Branchiostegal spine quite distinct, with a well-defined keel, spine on the 3rd abdominal tergum very much longer than those on the 4th and 5th. In the male the anterior border of the first abdominal somite is bilobed with the posterior lobe more pronounced and angular.

**Distribution:** Arabian Sea, Bay of Bengal, Andaman Sea and Hawaiian Islands, Southwest of Cochin, off Alleppey 300-450 m

*Ophlophorus typus* H. Milne-Edwards 1837

**Acanthephyra armata** A. Milne-Edwards, 1881

**Diagnostic characters:** The carapace is without a straight ridge or carina running on the entire length of the lateral surface i.e., from the hind margin of the orbit to the posterior edge of the carapace. Rostrum long, upcurved with 5 to 6 teeth on the dorsal side and only one tooth on the ventral side of rostrum. Dorsal carina of 3rd to 6th abdominal somites
Taxonomy, Biology and distribution of Deep sea shrimps

**Diagnostic characters:** Rostrum longer than carapace with 7 dorsal and 5 ventral teeth, extending much beyond the tip of the antennal scale. Branchiostegal spine small, forming a small projection on frontal border of carapace and without a carina. Surface of carapace finely pitted as in all the species of the purpurea group. Dorsal carinae of 3rd to 6th abdominal somites ending in pointed spines, that of 3rd somite the longest and of 4th and 5th of equal size and smallest. Four pairs of dorsolateral spines present on the telson.

**Distribution:** Southeast and Southwest coast of India
