Introduction

R language is the GNU arm of S language, which has taken the computational world by storm in the last decade. Starting as a compendium of statistical tools, this language has grown up into a canopy lording over a research analysis environment thereby subsuming many hitherto complicated manoeuvres onto the realms of syntactical simplicity. As this an exponentially expanding field of development with ever exploding information downpour, it would be a near impossible task to frame it onto a short simple foundational discourse. However in the subsequent sections we would try to view the potential and the extent of practicality we would unravel the hidden features of the software through a GUI envelop also apart from the regular console and syntax based one. To get its power more understandable we would visualize its forays into the field of analytics using medium scale examples from marine fisheries data.

R is "GNU S" — A language and environment for data manipulation, calculation and graphical display.

- R is similar to the award-winning S system, which was developed at Bell Laboratories by John Chambers et al.
- a suite of operators for calculations on arrays, in particular matrices,
- a large, coherent, integrated collection of intermediate tools for interactive data analysis,
- graphical facilities for data analysis and display either directly at the computer or on hardcopy
- a well developed programming language which includes conditionals, loops, user defined recursive functions and input and output facilities.

The core of R is an interpreted computer language.

- It allows branching and looping as well as modular programming using functions.
- Most of the user-visible functions in R are written in R, calling upon a smaller set of internal primitives.

It is possible for the user to interface to procedures written in C, C++ or FORTRAN languages for efficiency, and also to write additional primitives

R, S and S-plus- a brief time line

- S: an interactive environment for data analysis developed at Bell Laboratories since 1976
 - 1988 - S2: RA Becker, JM Chambers, A Wilks
 - 1992 - S3: JM Chambers, TJ Hastie
 - 1998 - S4: JM Chambers
- Exclusively licensed by AT&T/Lucent to *Insightful Corporation*, Seattle WA. Product name: "S-plus".
- Implementation languages C, Fortran.
- See:<http://cm.bell-labs.com/cm/ms/departments/sia/S/history.html>
- R: initially written by Ross Ihaka and Robert Gentleman at Dep. of Statistics of U of Auckland, New Zealand during 1990s.
- Since 1997: international "R-core" team of ca. 15 people with access to common CVS archive.

What R does and does not

<ul style="list-style-type: none"> ○ data handling and storage: numeric, textual ○ matrix algebra ○ hash tables and regular expressions ○ high-level data analytic and statistical functions ○ classes (Object Oriented "OO") ○ graphics ○ programming language: loops, branching, subroutines 	<ul style="list-style-type: none"> ○ is not a database, but connects to DBMSs ○ has no graphical user interfaces, but connects to Java, TclTk ○ language interpreter can be very slow, but allows to call own C/C++ code ○ no spreadsheet view of data, but connects to Excel/MsOffice ○ no professional / commercial support
---	--

R and statistics

- Packaging: a crucial infrastructure to efficiently produce, load and keep consistent software libraries from (many) different sources / authors, which are updated at a best possible refresh rate
- Statistics: most packages deal with statistics and data analysis and there are many conduit and value addition libraries which augment the statistical inference

- o State of the art: many statistical researchers provide their methods as R packages

Statistical Analysis

Data Analysis and Presentation happen to be the core strength of R software environment and the ease with which this is performed makes the environment as the ultimate winner. Faster computational routines and amenability of access and modification to interim steps and results makes the programming environment a winner.

- The R distribution contains functionality for large number of statistical procedures.
 - o linear and generalized linear models
 - o nonlinear regression models
 - o time series analysis
 - o classical parametric and nonparametric tests
 - o clustering
 - o smoothing
- R also has a large set of functions which provide a flexible graphical environment for creating various kinds of data presentations.

References

- **For R,**
 - o The basic reference is *The New S Language: A Programming Environment for Data Analysis and Graphics* by Richard A. Becker, John M. Chambers and Allan R. Wilks (the "Blue Book").
 - o The new features of the 1991 release of S (S version 3) are covered in *Statistical Models in S* edited by John M. Chambers and Trevor J. Hastie (the "White Book").
 - o Classical and modern statistical techniques have been implemented.
 - Some of these are built into the base R environment.
 - Many are supplied as packages. There are about 8 packages supplied with R (called "standard" packages) and many more are available through the cran family of Internet sites (via <http://cran.r-project.org>).
 - All the R functions have been documented in the form of help pages in an "output independent" form which can be used to create versions for HTML, LATEX, text etc.
 - The document "An Introduction to R" provides a more user-friendly starting point.

- An “R Language Definition” manual
- More specialized manuals on data import/export and extending R.

R installations

Getting Started

To install R on your MAC or PC the starting point has to be <http://www.r-project.org/>.

The R Project for Statistical Computing

PCA 5 vars
principle1 = dist, cor = cor

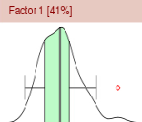

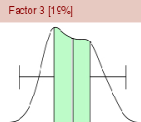

Clustering 4 groups

Factor 1 [41%]

Factor 3 [19%]

Getting Started:

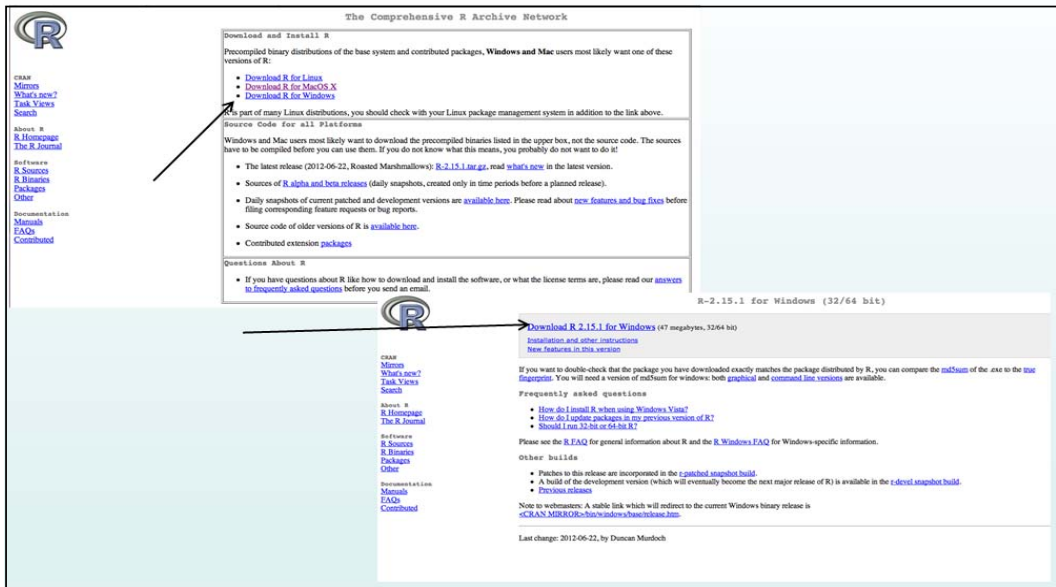

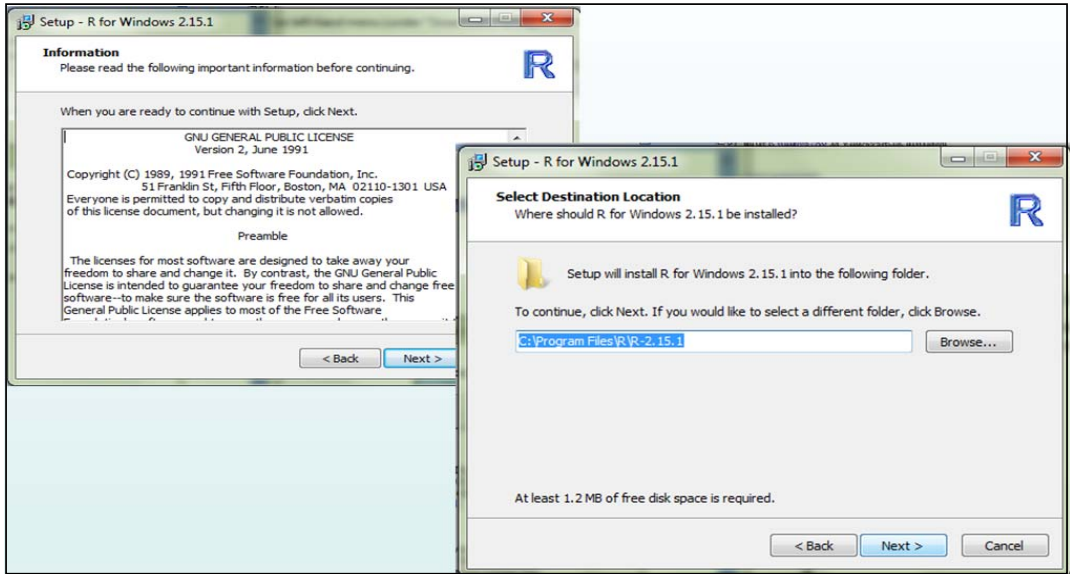

- R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To [download R](#), please choose your preferred [CRAN mirror](#).
- If you have questions about R like how to download and install the software, or what the license terms are, please read our [answers to frequently asked questions](#) before you send an email.

News:

- R version 2.15.1 (Roasted Marshmallows) has been released on 2012-06-22.
- [The R Journal Vol.4/1](#) is available.
- [useR! 2012](#), took place at Vanderbilt University, Nashville Tennessee, USA, June 12-15, 2012.
- [useR! 2013](#), will take place at the University of Castilla-La Mancha, Albacete, Spain, July 10-12 2013.

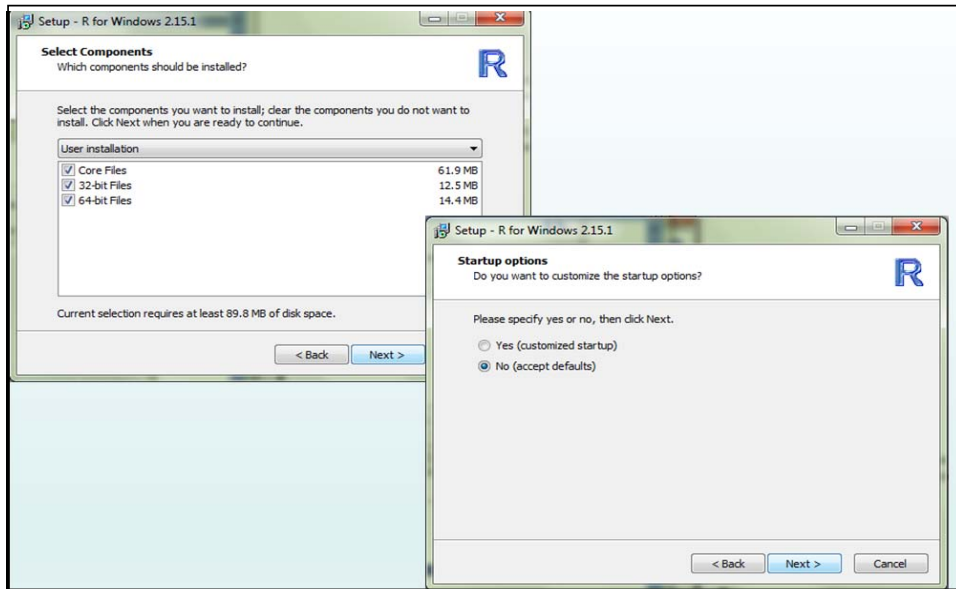

Depending on the choice of operating system the installer/ zip file with checksum may be downloaded and verified.

An effort to download R for Windows would have the following sequence of interactions with the portal, whose snapshots are given below:

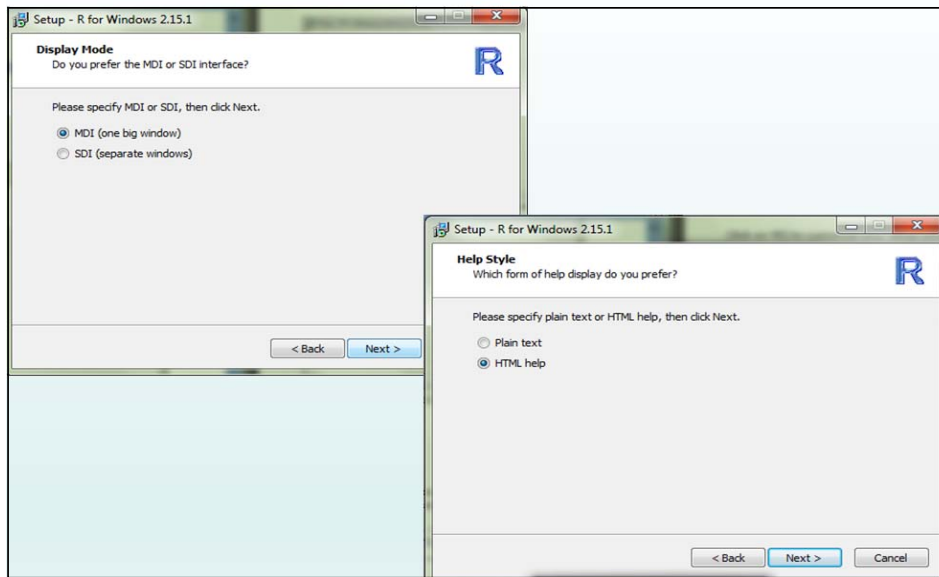

It's always a good idea to download all the files.

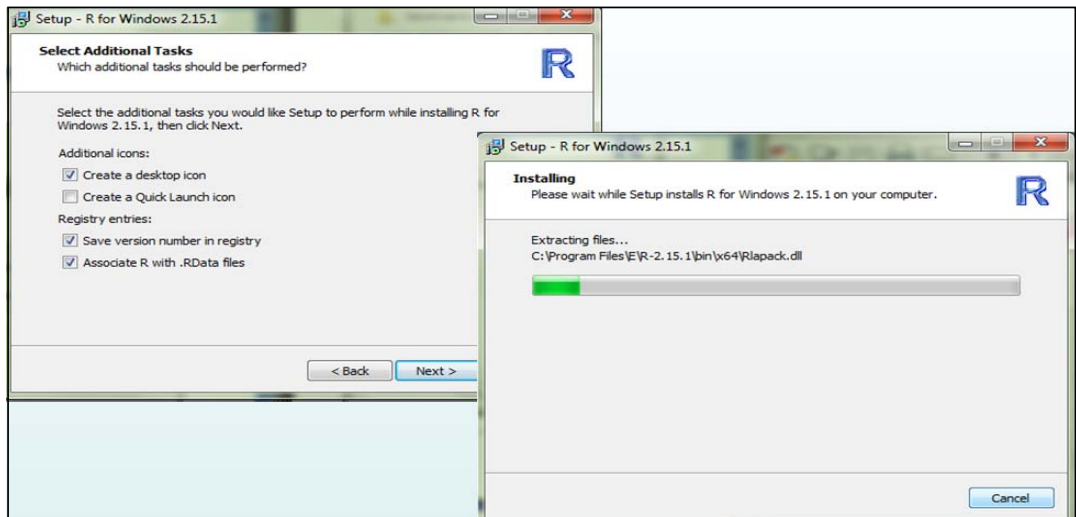

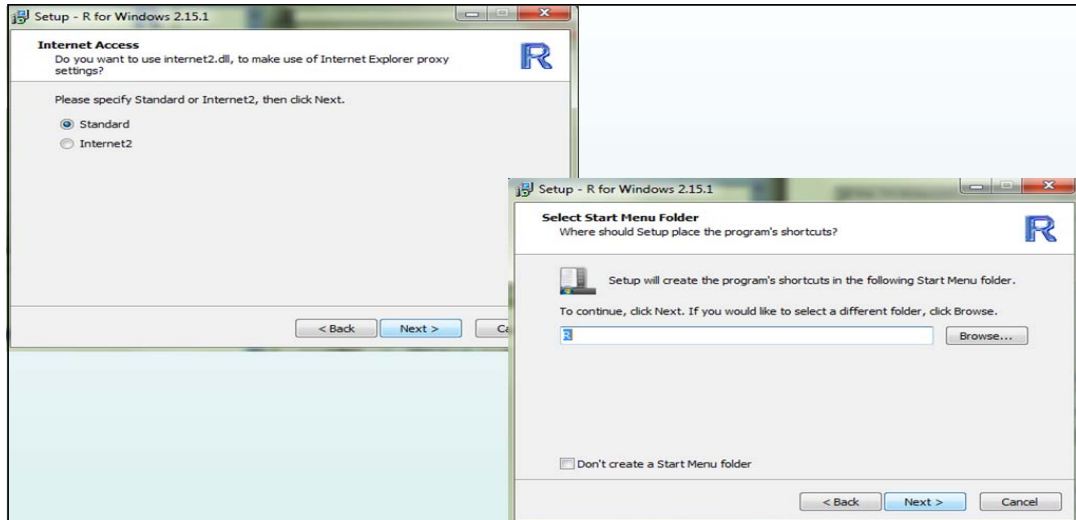

MDI is when the windows will be contained within one large window.

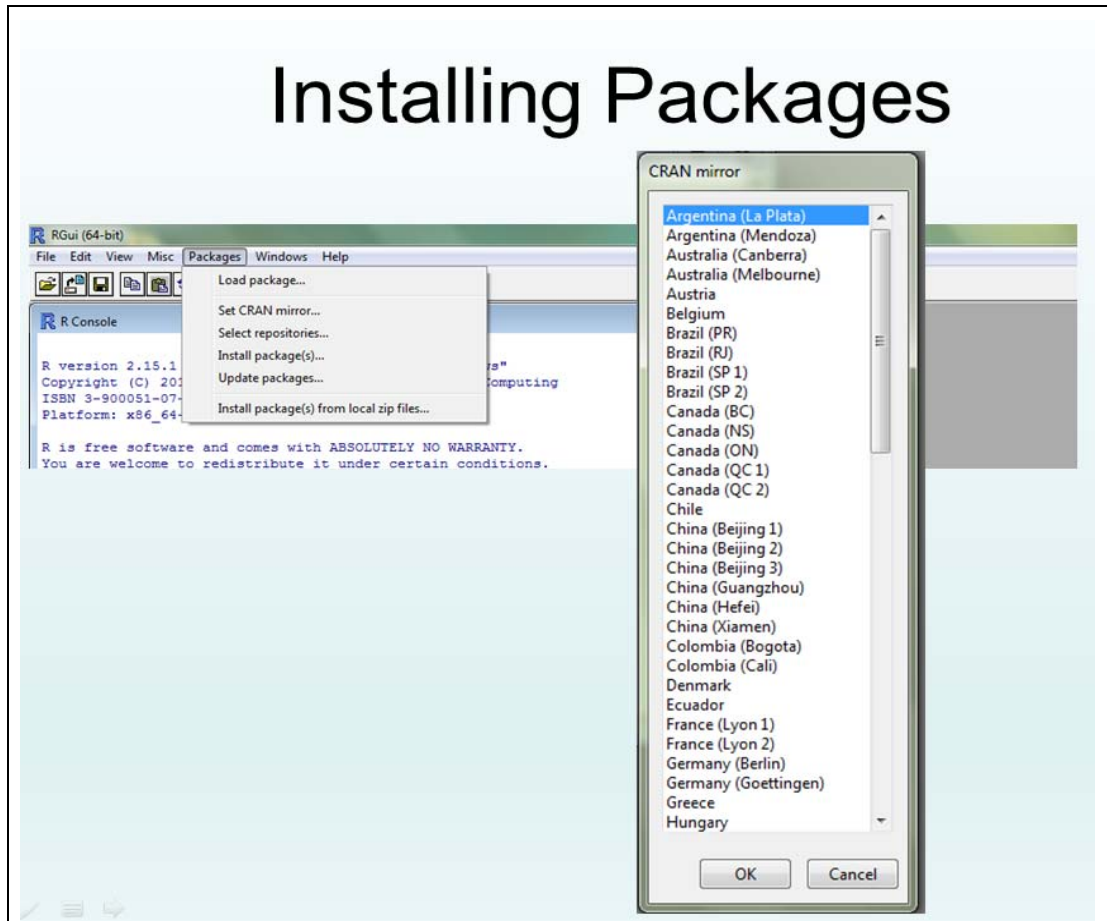

This is similar to how Excel is setup. SDI is a single document interface where every item will get its own window. This is similar to how SPSS is set up where it has separate data editor, viewer, and syntax windows. Once you choose which you prefer click next. Choosing either html or plain text and clicking is the next step. The installation may take awhile

To install packages on Windows, clicking on packages and install packages will be the next step.

Scrolling down to country nearest and choosing a "mirror" that is close is the next step

Scrolling down list until the requisite package is the next step, keeping in mind that R lists things in alphabetical order and by uppercase than lowercase. Once a package is clicked to load, R will install not only the package but all of the packages needed to run the package, including the dependencies.

To actually use the package, one has to go back to the package tab and click on load package.

Using Help Command

?solve translates on to giving details of help information about “solve” function whilst help.search or ?? allows searching for help in various ways

```

Rcommander – A graphical interaction “skin” for R

R provides a powerful and comprehensive system for analysing data and when used in conjunction with the R-commander (a graphical user interface, commonly known as Rcmdr) it also provides one that is easy and intuitive to use. Basically, R provides the engine that carries out the analyses and Rcmdr provides a convenient way for users to input commands. The Rcmdr program enables analysts to access a selection of commonly-used R commands using a simple interface that should be familiar to most computer users. It also serves the important role of helping users to implement R commands and develop their knowledge and expertise in using the command line --- an important skill for those wishing to exploit the full power of the program.(<http://www.rcommander.com/>)

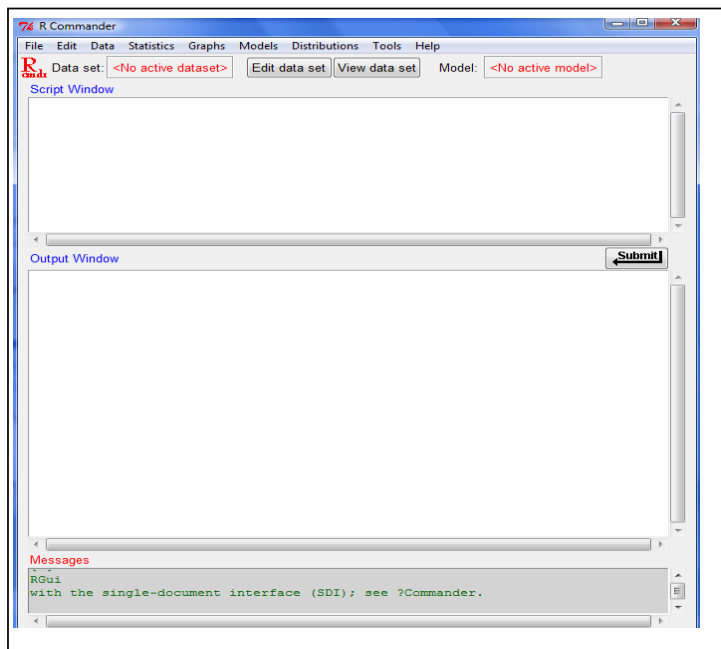

a) Loading R Commander

- Packages -> Install Packages -> Cran Mirror Selection -> Rcmdr

b) Opening R Commander

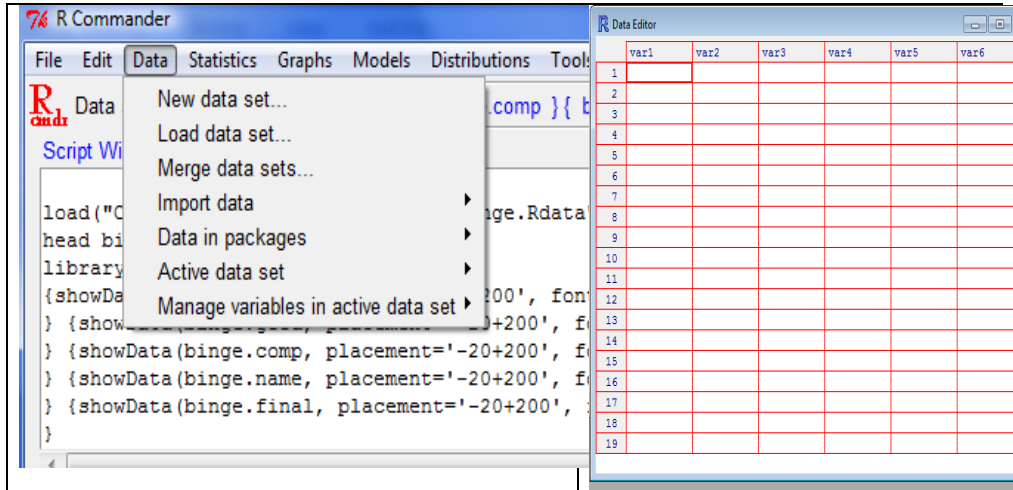

- Open R -> Packages -> Load Packages -> Rcmdr

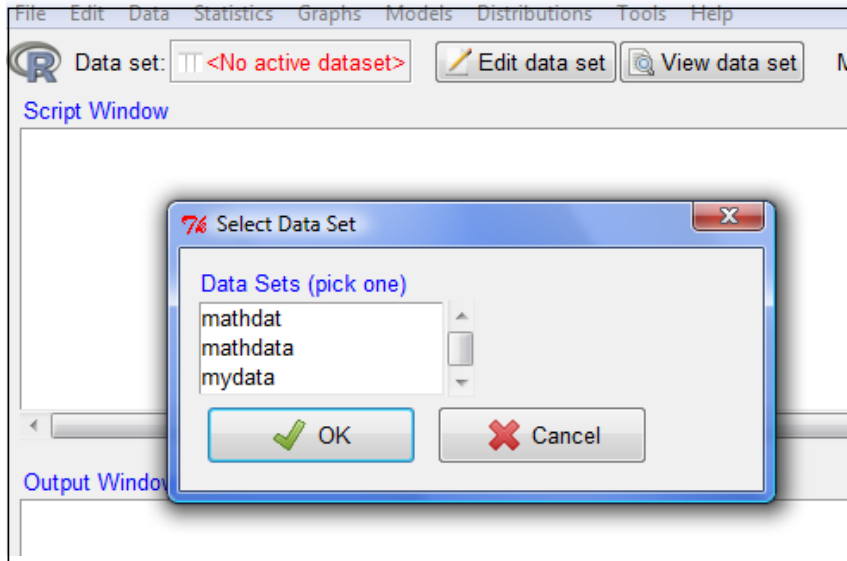

c) Loading Data

Data->Load data

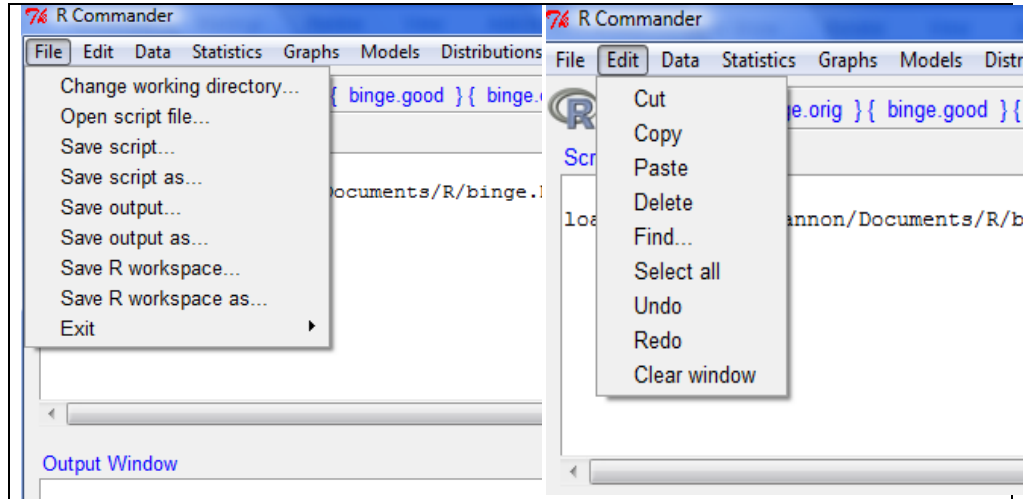

d) Active Data selection

Data ->Active data set -> Select active data set

e) Menu driven File edit options

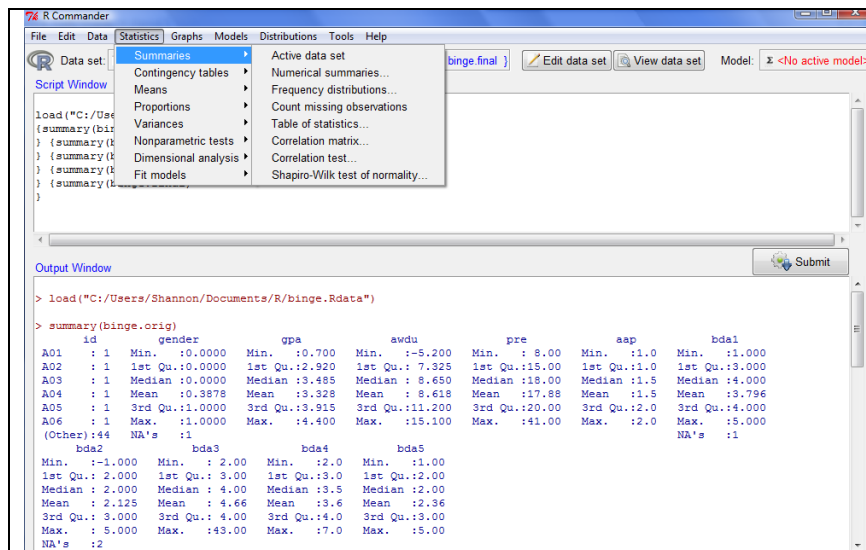

Script will save it as an R file .R and Output will save it as a text file .txt

f) Summary of the data

Statistics -> Summaries

Numerical Summaries – can also provide mean, standard deviation, skewness, kurtosis etc..

g) Mean, Standard Deviation, Skewness, Kurtosis

The screenshot shows the R Commander interface. On the left, the 'Numerical Summaries' dialog box is open, with 'Mean', 'Standard Deviation', and 'Quantiles' checked. The 'Quantiles' section is set to 'Type 2' with values '0, .25, .5, .75, 1'. On the right, the 'Script Window' contains the following R code:

```
library(abind, pos=4)
library(e1071, pos=4)
numSummary(binge[,c("aap", "awdu", "bda1", "bda2")], statistics=c("mean",
+ "sd", "quantiles"), quantiles=c(0,.25,.5,.75,1))
```

The 'Output Window' shows the results of the code execution:

```
> library(abind, pos=4)
> library(e1071, pos=4)
> numSummary(binge[,c("aap", "awdu", "bda1", "bda2")], statistics=c("mean",
+ "sd", "quantiles"), quantiles=c(0,.25,.5,.75,1))
      mean      sd      0% 25% 50% 75% 100% n
aap 1.456522 0.5036102 1.0 1.0 1.0 2.0 2.0 46
awdu 8.532609 3.5233647 -5.2 7.3 8.7 11.2 15.1 46
bda1 3.739130 0.8099556 1.0 3.0 4.0 4.0 5.0 46
bda2 2.086957 0.9147213 -1.0 2.0 2.0 3.0 5.0 46
```

h) Contingency Tables

The screenshot shows the R Commander interface. The 'Statistics' menu is open, and 'Contingency tables' is selected. The 'Enter Two-Way Table' dialog box is open, showing 'Number of Rows' and 'Number of Columns' both set to 2. The 'Compute Percentages' section has 'No percentages' selected. The 'Hypothesis Tests' section has 'Chi-square test of independence' checked. In the 'Script Window', the following R code is visible:

```
> tapply(binge$bda1, list(id=binge$id), mean, na.rm=TRUE)
```

The 'Output Window' shows the resulting contingency table:

id	A01	A02	A03	A04	A05	A06	A07	A08	A09	A10	A11	A12	A13	A14	A15	A16	A17	A18	A19	A20
3	3	3	3	3	3	3	3	5	4	5	3	5	4	4	4	4	4	3	4	4
A21	A22	A23	A24	A25	B02	B05	B06	B07	B08	B09	B10	B11	B12	B13	B14	B15	B17	B18	B19	

i) Correlations in R Commander

Correlation analysis can be done with R as follows.

Correlation is a bivariate analysis that measures the strengths of association between two variables and the direction of the relationship. In terms of the strength of relationship, the value of the correlation coefficient varies between +1 and -1. When the value of the correlation coefficient lies around ± 1 , then it is said to be a perfect degree of association between the two variables. As the correlation coefficient value goes towards 0, the relationship between the two variables will be

weaker. the direction of the relationship is simply the + (indicating a positive relationship between the variables) or - (indicating a negative relationship between the variables) sign of the correlation.

Usually, in statistics, we measure four types of correlations: Pearson Correlation, Kendall rank correlation, Spearman correlation, and the Point-Biserial correlation. The software below allows you to very easily conduct a correlation.

The screenshot shows the R Commander interface. The main window displays the results of a linear regression model. The 'Output Window' shows the following statistics:

```

Residuals:
    Min       1Q   Median       3Q      Max
-0.97030  0.02400  0.02644  0.02077  0.03000

Coefficients:
            Estimate Std. Error t value Pr(>|t|)
(Intercept)  0.0776577   0.0383882   2.02668  <2e-16 ***
id          -0.0001138   0.0009709  -0.11611  0.91166
---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 0.163 on 73 degrees of freedom
Multiple R-squared:  0.0002338, Adjusted R-squared: -0.01346
F-statistic: 0.01707 on 1 and 73 DF,  p-value: 0.8964

```

The 'Messages' window at the bottom shows error messages:

```

[22] ERROR: You must select a response variable.
[23] ERROR: Response and explanatory variables must be different.

```

Overlaid on the right is the 'Correlation Matrix' dialog box. It has a list of variables with 'id' and 'pl_1a' selected. Under 'Type of Correlations', 'Pearson product-moment' is selected with a radio button. Other options include 'Spearman rank-order', 'Partial', and 'Pairwise p-values for Pearson or Spearman correlations'. Buttons for 'OK', 'Cancel', 'Reset', and 'Help' are at the bottom.

j) Independent T-Test

The independent t-test, also referred to as an independent-samples t-test, independent measures t-test or unpaired t-test, is used to determine whether the mean of a dependent variable (e.g., weight, anxiety level, salary, reaction time, etc.) is the same in two unrelated, independent groups (e.g., males vs females, employed vs unemployed, under 21 year olds vs those 21 years and older, etc.). Specifically, you use an independent t-test to determine whether the mean difference between two groups is statistically significantly different to zero.

Statistics->Independent T Test

The screenshot displays the R Studio interface. On the left, the 'Independent Samples t-Test' dialog box is open. The 'Groups (pick one)' list contains 'fac.gen'. The 'Response Variable (pick one)' list contains 'aap', 'awdu', 'gender', and 'gpa'. The 'Alternative Hypothesis' is set to 'Two-sided', the 'Confidence Level' is '.95', and 'Assume equal variances?' is set to 'No'. The 'Difference' is '<No groups selected>'. The 'OK' button is highlighted. On the right, the 'Script Window' shows R code for loading data, performing a t-test, and applying a function. The 'Output Window' shows the results of the Welch Two Sample t-test, including the t-statistic, degrees of freedom, p-value, and confidence interval.

k) One Way ANOVA

ANOVA (Analysis of Variance) is a statistical technique that assesses potential differences in a scale-level dependent variable by a nominal-level variable having 2 or more categories. For example, an ANOVA can examine potential differences in IQ scores by Country (US vs. Canada vs. Italy vs. Spain). The ANOVA, developed by Ronald Fisher in 1918, extends the t and the z test which have the problem of only allowing the nominal level variable to have just two categories. This test is also called the Fisher analysis of variance. ANOVAs are used in three ways: one-way Anova, two-way ANOVA, and N-way Multivariate ANOVA.

One-Way ANOVA

A one-way ANOVA refers to the number of independent variables--not the number of categories in each variable. A one-way ANOVA has just one independent variable. For example, difference in IQ can be assessed by Country, and Country can have 2, 20, or more different Countries in that variable. The software below allows you to easily conduct an ANOVA.

Statistics->One Way ANOVA

The screenshot shows the R Studio interface. On the left, the 'One-Way Analysis of Variance' dialog box is open. The 'Enter name for model:' field contains 'AnovaModel.1'. Under 'Groups (pick one)', 'fac.gen' and 'id' are selected. Under 'Response Variable (pick one)', 'aap', 'awdu', 'gender', and 'gpa' are listed. The 'Pairwise comparisons of means' checkbox is unchecked. At the bottom are 'OK', 'Cancel', 'Reset', and 'Help' buttons.

The 'Script Window' on the right contains the following R code:

```
var.equal=FALSE, data=binge.final)
tapply(binge.final$awdu, binge.final$fac.gen, var, na.rm=TRUE)
leveneTest(binge.final$awdu, binge.final$fac.gen, center=median)
library(multcomp, pos=4)
library(abind, pos=4)
AnovaModel.1 <- aov(awdu ~ fac.gen, data=binge.final)
summary(AnovaModel.1)
numSummary(binge.final$awdu, groups=binge.final$fac.gen,
            statistics=c("mean", "sd"))
```

The 'Output Window' shows the following output:

```
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

> library(multcomp, pos=4)
> library(abind, pos=4)
> AnovaModel.1 <- aov(awdu ~ fac.gen, data=binge.final)
> summary(AnovaModel.1)
      Df Sum Sq Mean Sq F value Pr(>F)
fac.gen  1  24.1  14.098   1.584  0.214
Residuals 46 409.3   8.899
2 observations deleted due to missingness

> numSummary(binge.final$awdu, groups=binge.final$fac.gen,
+            statistics=c("mean", "sd"))
      mean      sd data:in data:NA
0 8.360714 2.588055  28      2
1 9.460000 3.467807  20      0
```

I) Factor Analysis

Factor analysis is a technique that is used to reduce a large number of variables into fewer numbers of factors. This technique extracts maximum common variance from all variables and puts them into a common score. As an index of all variables, we can use this score for further analysis. Factor analysis is part of general linear model (GLM) and this method also assumes several assumptions: there is linear relationship, there is no multicollinearity, it includes relevant variables into analysis, and there is true correlation between variables and factors. Several methods are available, but principle component analysis is used most commonly.

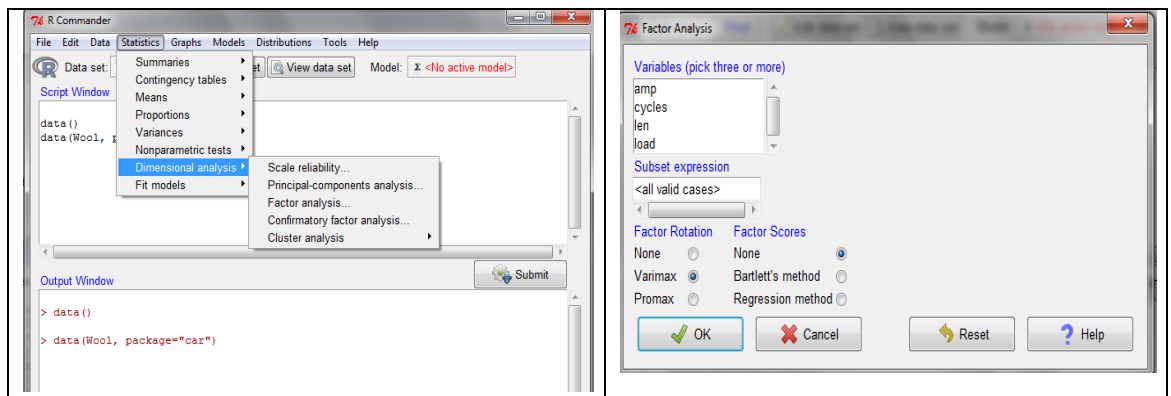

Types of factoring:

There are different types of methods used to extract the factor from the data set:

- 1. Principal component analysis:** This is the most common method used by researchers. PCA starts extracting the maximum variance and puts them into the first factor. After that, it removes that variance explained by the first factors and then starts extracting maximum variance for the second factor. This process goes to the last factor.
- 2. Common factor analysis:** The second most preferred method by researchers, it extracts the common variance and puts them into factors. This method does not include the unique variance of all variables. This method is used in SEM.
- 3. Image factoring:** This method is based on correlation matrix. OLS Regression method is used to predict the factor in image factoring.

- Maximum likelihood method:** This method also works on correlation metric but it uses maximum likelihood method to factor.
- Other methods of factor analysis:** Alfa factoring outweighs least squares. Weight square is another regression based method which is used for factoring.

Result are shown as follows

```
Script Window

> .FA <- factanal(~aap+awdu+bdal, factors=1, rotation="varimax",
+ scores="none", data=binge.orig)
> .FA
remove(.FA)
library(sem, pos=4)

> .FA <- factanal(~aap+awdu+bdal, factors=1, rotation="varimax",
+ scores="none", data=binge.orig)
> .FA

Call:
factanal(x = ~aap + awdu + bdal, factors = 1, data = binge.orig, scores = "none", rotation = "varimax")

Uniquenesses:
  aap  awdu  bdal
0.849 0.324 0.596

Loadings:
Factor1
aap  0.388
awdu 0.822
bdal 0.636

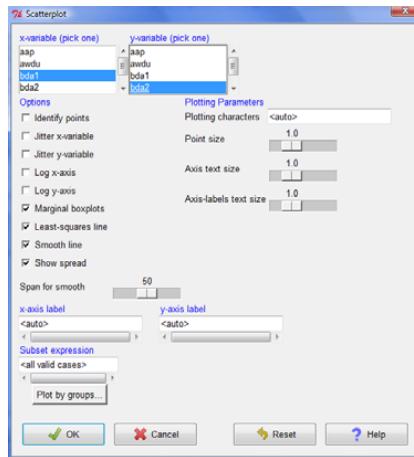

SS loadings  1.231
Proportion Var 0.410

The degrees of freedom for the model is 0 and the fit was 0

> remove(.FA)
> library(sem, pos=4)
```

J) Graphs
Graphs->Scatter plot

Graphs->Box plot

Chapter4:-R Basics

R is object base

Types of objects (scalar, vector, matrices and arrays Assignment of objects)

Building a data frame

Operation Symbols

Symbol	Meaning
+	Addition
-	Subtraction
*	Multiplication
/	Division
%%	Modulo (estimates remainder in a division)
^	Exponential

R as a Calculator

```

Numbers in R: NAN and NA

NAN (not a number) NA (missing value) -Basic handling of missing values

Missing values are noise to statistical estimations. We are going to learn a basic command for handling missing values.

```
x<-c(1,2,3,4,5,6,NA)
mean(x)
## [1] NA
mean(x,na.rm=TRUE)
## [1] 3.5
```

Objects in R

Objects in R obtain values by assignment.

This is achieved by the gets arrow, <-, and not the equal sign, =.

Objects can be of different kinds.

Built in Functions

R has many built in functions that compute different statistical procedures.

Functions in R are followed by (). Inside the parenthesis we write the object (vector, matrix, array, dataframe) to which we want to apply the function.

```
# Create a sequence of numbers from 32 to 44.
print(seq(32,44))
## [1] 32 33 34 35 36 37 38 39 40 41 42 43 44
# Find mean of numbers from 25 to 82.
print(mean(25:82))
```

```
## [1] 53.5
# Find sum of numbers frm 41 to 68.

print(sum(41:68))
## [1] 1526
```

Vectors

Vectors are variables with one or more values of the same type. A variable with a single value is known as scalar. In R a scalar is a vector of length 1. There are at least three ways to create vectors in R: (a) sequence, (b) concatenation function, and (c) scan function.

Create two vectors of different lengths.

```
vector1 <-c(5,9,3)
vector2 <-c(10,11,12,13,14,15)
vector1
## [1] 5 9 3
vector2
## [1] 10 11 12 13 14 15
```

Arrays

Arrays are numeric objects with dimension attributes. The difference between a matrix and an array is that arrays have more than two dimensions.

```
# Take the above vectors as input to the array.
result <-array(c(vector1,vector2),dim =c(3,3,2))
print(result)
## , , 1
##
##  [,1] [,2] [,3]
## [1,]  5 10 13
## [2,]  9 11 14
## [3,]  3 12 15
##
## , , 2
##
##  [,1] [,2] [,3]
## [1,]  5 10 13
## [2,]  9 11 14
## [3,]  3 12 15
```

Matrices

A matrix is a two dimensional array. The command `colnames`

```
# Elements are arranged sequentially by row.
M <-matrix(c(3:14), nrow =4, byrow =TRUE)
print(M)

##      [,1] [,2] [,3]
## [1,]  3  4  5
## [2,]  6  7  8
## [3,]  9 10 11
## [4,] 12 13 14
```

String Characters

In R, string variables are defined by double quotation marks.

```
letters<-c("a","b","c")
letters

## [1] "a" "b" "c"
```

Subscripts and Indices

Select only one or some of the elements in a vector, a matrix or an array. We can do this by using subscripts in square brackets [].

In matrices or dataframes the first subscript refers to the row and the second to the column.

Dataframe

Researchers work mostly with dataframes . With previous knowledge you can built dataframes in R Also, import dataframes into R.

```
# Create the data frame.
emp.data <-data.frame(
  emp_id =c (1:5),
  emp_name =c("Rick","Dan","Michelle","Ryan","Gary"),
  salary =c(623.3,515.2,611.0,729.0,843.25),

  start_date =as.Date(c("2012-01-01", "2013-09-23", "2014-11-15", "2014-05-11",
"2015-03-27")),
  stringsAsFactors =FALSE
)
```

```
# Print the data frame.
```

```
print(emp.data)
```

```
## emp_id emp_name salary start_date
## 1 1 Rick 623.30 2012-01-01
## 2 2 Dan 515.20 2013-09-23
## 3 3 Michelle 611.00 2014-11-15
## 4 4 Ryan 729.00 2014-05-11
## 5 5 Gary 843.25 2015-03-27
```

A journey wading through the amazing summarizing and analytical capabilities of R- a case study.

Let the presumed data pertain to landings and standardized effort of a maritime state estimated by ICAR-CMFRIduring the interregnum 1997 to 2013

Calling file in R

```
klm<-read.csv("C:/Users/cmfri/Desktop/cpue_spcode_kldata.csv",header=TRUE)
```

To know header portion of the data set

```
head(klm)

```

If one wants to study monthly catch grouped information so that an idea about issues like which month (used as a group) would have etched up maximum landings/ catch, then simple literally rooted commands like `describeBy` (psych) or `aggregate` would come in handy.

```
library(psych)
```

```
describeBy(klm$raised,klm$month)
```

```

```

Chapter 5: Plots in R

```
##scatter plot
```

```
sp3621<-sp362[c(1:2,4)]
```

```
attach(sp3621)
```

```
## The following objects are masked from klm:
```

```
## month, raised, year
```

```
plot(year,raised,main="sardine catch[1997-2013]",xlab="year",ylab="catch(kg))
```

```
##Histogram
```

```
hist(raised,main="Histogram for  
oilsardine catch[1997-2013]",  
xlab="catch",  
col="green",  
breaks=5)
```

Histogram for oilsardine catch[1997-2013]

```
##Bar plot
```

```
barplot(raised, main="sardine catch  
Distribution",  
xlab="Number of years")
```

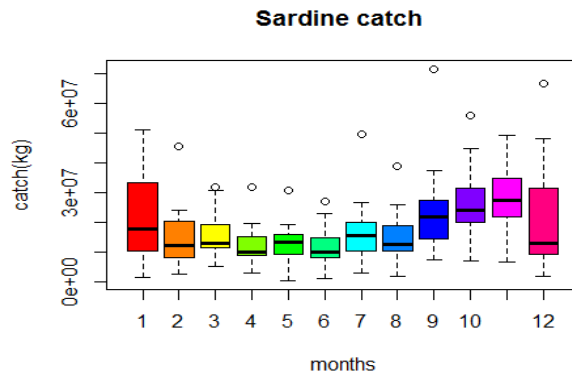

sardine catch Distribution

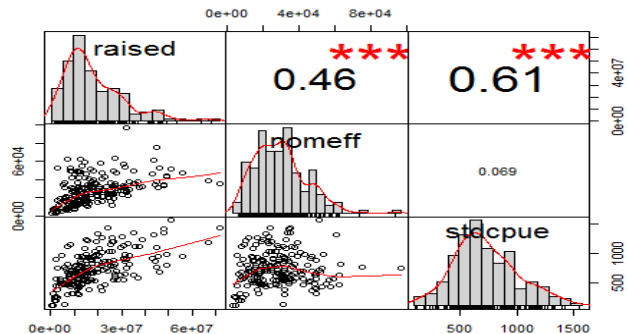

Boxplot in r

```
# Boxplot of catch vs month  
boxplot(raised~month,data=sp3621,  
main="Sardine catch ",  
xlab="months",  
ylab="catch(kg)",col=rainbow(length  
(unique(month))))
```

to plot a correlation in r

```
##we select sardine correlations  
cordat<-sp362[,4:6]  
library(PerformanceAnalytics)  
chart.Correlation(cordat,method=  
"pearson")
```
