THE HISTORY OF ECHINODERMOLOGY OF THE INDIAN OCEAN*

D. B. JAMES
Central Marine Fisheries Research Institute, Cochin-682 018

ABSTRACT

Napoleon's scientific contingent made one of the first collections of echinoderms of the Indian Ocean when they visited the Gulf of Suez and the north-western coast of the Red Sea. Our knowledge of the echinoderms of the Indian Ocean is mainly due to the various expeditions, starting with the Challenger Expedition (1873-1874) to the recent International Indian Ocean Expedition (1961-1965) organised with the co-operation of several nations. Apart from these expeditions small vessels engaged in marine survey notably the R.I.M.S. Investigator and the vessels belonging to the Union of South African Fisheries and Marine Biological Survey have collected many echinoderms from the Indian and South African waters respectively. Numerous individual workers who collected the echinoderms from various parts of the Indian Ocean have also significantly contributed to our knowledge of the echinoderms of the Indian Ocean. This paper reviews a history of the echinodermology of the Indian Ocean.

INTRODUCTION

The echinoderms of the Indian Ocean are known since very ancient times. Plancus and Gaultier reported some echinoderms from Goa (west coast of India) as early as 1743. Napoleon's scientific contingent made one of the first collections of echinoderms of the Indian Ocean when they visited the Gulf of Suez and the northern Red Sea. Our knowledge of the echinoderms of the Indian Ocean is mainly due to various expeditions such as Challenger Expedition (1873-1874), Deutsches Tiefsee Expedition, 1902-1903 (Gauss), Percy Sladen Trust Expedition, 1904 (Sealark), Willebrod Snellius Expedition (1929), John Murray Expedition, 1933-1934 (Mabuhay), Swedish Deep Sea Expedition, 1947-1948 (Albatross) and the Danish Deep Sea Expedition, 1950-1951 (Galathea). The recent International Indian Ocean Expedition (1961-1965) organised with the co-operation of several nations is bound to bring several echinoderms to light. A. M. Clark and Rowe (1971) have brought out a monograph on the shallow water Indo-West Pacific echinoderms dealing with all the species of Indian Ocean up to a depth of 20 metres.

Apart from the various expeditions mentioned above small vessels engaged in marine survey notably the R.I.M.S. Investigator and the vessels belonging to the Union of South African Fisheries and Marine Biological Survey have collected several echinoderms from the Indian and South African waters respectively. A large number of naturalists and scientists who collected echinoderms from various places in the Indian Ocean have also significantly contributed to our knowledge of the echinoderms of the Indian Ocean.

* Presented at the Symposium on 'Indian Ocean and Adjacent Seas—Their Origin, Science and Resources' held by the Marine Biological Association of India at Cochin from January 12 to 18, 1971.
In addition to the expedition reports and other papers published on the echinoderms from several places along the Indian Ocean a number of Indian Ocean species find place in monographs, catalogues, revisional works and other general papers which deal material on a global basis. Among monographs mention may be made of the works of A. H. Clark (1915-1950) and A. H. Clark and A. M. Clark (1967) on the living Comatulids and Mortensen (1928-1951) on the echinoids. Revisional works by A. Agassiz (1872-1874) on the echioida, A. M. Clark and A. H. Clark (1954) on the genus Tethyaster, Duncan (1889) on echioida, Doderlein (1915) on the genus Anthenea and Fell (1962) on the Family Amphiphiuridae deal with the echinoderms of the Indian Ocean. General works by Müller and Troschel (1842) on asteroids and ophiuroids, Gray (1840, 1866), Perrier (1875), John (1946, 1950), A. M. Clark (1951, 1953) and Madsen (1955) on asteroids, Ludwig (1882), Mitsukuri (1912) and Panning (1929-1935) on holothurians and Koehler (1907) and Matsumoto (1915, 1917) on ophiuroids have made references to the material from the Indian Ocean.

The catalogues of Ramsay (1885) on the echioids of the Australian Museum, H. L. Clark (1925) on the echioids of the British Museum, Downey (1969) on the types of echioids and ophiuroids of the American Museums and James (1989) on the echioids of the reference collection of the Central Marine Fisheries Research Institute have listed echioids belonging to the Indian Ocean.

The Challenger Expedition made some collections in the southern Indian Ocean. The Challenger Expedition Reports are very important in that they not only include material collected from the Indian Ocean but summarise data on all the species known at the time of writing. A. Agassiz (1879, 1881) on echinoids, Carpenter (1884, 1888) on crinoids, Lyman (1878-1882) on ophiuroids, Sladen (1882, 1883) on asteroids and Theel (1882, 1886) on holothurians published the Challenger reports.

The echioids of South Africa were brought to light mainly due to the exploration conducted by the vessels belonging to the Union of South African Fisheries and Marine Biological Survey. The South African echioids were well treated by Bell (1888-1905), Mortensen (1925-1935), H. L. Clark (1923) and A. M. Clark (1952). In addition to the above reports Gislen (1931) and A. H. Clark (1952) on crinoids, Dechmann (1944, 1948) and Cherbonnier (1952) on holothurians and Balinsky (1962) on ophiuroids published accounts from South African waters. Other papers from this region include those of Britten (1910), Heding (1937, 1938), John (1939), Gilchrist (1920), A. H. Clark and A. M. Clark (1952) and A. M. Clark and Courtman-Stock (1976).

The East African echioids from places like Zanzibar are well reported by Peters (1851), Peffer (1895) and Bell (1903). Other works for the same region are those of Stabs (1879), Perrier (1875-1893), Bianconi (1863), Von Martens (1886), Lampert (1893), Ludwig (1893) and John (1937).

Among the Islands such as Mauritius, Reunion, Rodriguez, Seychelles and Kerguelen the echioids of Mauritius are well known. This is chiefly due to the efforts of Robillard who collected the material and de Loriol who reported on the same. The works from Mauritius include those of de Loriol (1883-1885), Bell (1889-1892), Cherbonnier (1953) and James (1969). Mortensen (1934) reported on the echioids of Madagascar while Hoffman (1874) and Decary (1921-1930) on the echioids of Madagascar and Reunion Islands. E. A. Smith (1876) reported on the echioids of Rodriguez Island. Kerguelen Island which is situated far

\[32\]
south in the Indian Ocean also received some attention. Koehler (1910) and E. A. Smith (1876, 1879) reported on the echinoderms of the Island.

The echinoderms of the Red Sea are fairly well known due to the efforts of many who made collections from that area. The echinoderms from the Gulf of Aqaba were collected mainly by the 'Manihini Expedition'. The echinoderms of the Suez Canal were brought to light by the Cambridge Expedition. Napoleon's scientific contingent made one of the first collections in the Red Sea when they visited the Gulf of Suez and the northern coast of the Red Sea. The collections made by them were beautifully figured by Savignyi (1809-1817). Later Audouin (1826) gave captions to the figures. The classical work 'System der Asteriden' by Müller and Troschel (1842) also includes several echinoderms from Red Sea collected by Ehrenberg. Since then Gray (1872), Bostan (1892), Russo (1893-1899), Mazzetti (1895), Herouard (1899), Leopoldi (1896), Fourtan (1903, 1904), Chadwick (1908), A. H. Clark (1909), Helfer (1912), Erwe (1919), Burnfield (1926), Tortonesse (1926), A. H. Clark and Bowen (1949), A. H. Clark (1952), Cherbonnier (1954-1967), Tsurnmal and Marder (1966), Magnus (1967) and Achituv (1969) have reported on the echinoderms of the Red Sea. A. M. Clark (1967) has summarised the known echinoderms except holothurians from the Red Sea. James (1969) and James and Pearse (1971) have reported on some echinoderms from the Gulf of Suez and the northern Red Sea.

The echinoderms of the Persian Gulf are known largely due to the efforts of the Danish investigations. As a result of the Danish investigations the works of Gislen (1940) on crinoids, Heding (1940) on holothurians and Mortensen (1940) on asteroids, ophiuroids and echinoids have come out. A. Agassiz (1872) in his revision of the echini and H. L. Clark (1912) in his work on the Hawaiian echini mentioned a few echinoids from the Persian Gulf. H. L. Clark (1915) on all groups of echinoderms. Other publications from this region are those of Collier (1830), E. A. Smith (1878), Bell (1882-1887), Sarasin and Sarasin (1885, 1886), Walter (1885), Ludwig (1887-1891), Döderlein (1888) and Sarasin (1887).
The echinoderms of the Indian Coast were poorly known till the present author took up the study of this group from the Indian Seas a few years ago. As a result of his efforts the echinoderms of Gulf of Mannar, Palk Bay and Andaman and Nicobar Islands are now well known (James MS.). Echinoderms from Laccadives, Jamnagar, Bombay, Karwar, Cochin, Vizhinjam, Cape Comerin, Tuticorin, Mandapam, Waltair and Puri were also collected, studied and reported in the following publications (James, 1967, 1968a, 1968b, 1969, 1971a, 1971b, 1973a, 1973b, 1978). Plancus and Gaultier (1743) from Goa, Thurston (1889) from Rameswaram, Bell (1888) from Tuticorin, Gravely (1927) from Krusadai Island and the neighbouring places, Kuriyan (1950) from Krusadai Island, Ajyar (1938), Gravely (1941) and Nair (1946) from Madras, Kurian (1953) from Travancore, Patil (1953) from Karwar, Sanne and Chhapgar (1962) from Bombay, Rao (1968) from Waltair and Gopalakrishnan (1969) from Port Okha have published short accounts of echinoderms collected by them.

The echinoderms from the seas around India (Bay of Bengal) are fairly well known because of the extensive dredging done by R.I.M.S. Investigator in the littoral and beyond the shelf region. About 800 species are now known from the Indian Seas. Ludwig (1878, 1879), Bell (1880-1889), Wood-Mason and Alcock (1891), Tull-Walsh (1891), Alcock (1892-1902), Anderson (1894), Alcock and Anderson (1895), Koehler (1899-1927), Koehler and Vaney (1905-1910), Döderlein (1906, 1912), A. H. Clark (1912-1936), Pearson (1913), Bomford (1913), Hertz (1927) Setna (1930), Liberkind (1932), Ludwig and Heding (1935), Macan (1938), H. L. Clark (1939, 1948), Mortensen (1939) and Heding (1940) have published accounts of the echinoderms of the Indian Seas.

The first collections of echinoderms from the Andaman and Nicobar Islands came as a result of the efforts made by Dr. John Anderson who created interest in Col. Cadell who was stationed at Port Blair. Mr. Booley also made lot of collections for the Indian Museum from Port Blair. Bell (1887) reported on the echinoderms from Andaman Island. Anderson (1907) and James (1966) have reported an echinoid from Port Blair. The personnel of R.I.M.S. Investigator also have made collections at Port Blair and other places in the Andaman and Nicobar Islands when the vessel called at various places. The echinoderms collected by them find mention in the various reports of the Investigator. Lütken (1865, 1872), Theel (1886) and Marktanner (1887) listed some asteroids, ophiuroids and holothurians respectively from Nicobar. The present author first visited Andaman and Nicobar Islands in January-February, 1965 and again during 1975-78 and made extensive collections of echinoderms from the intertidal region. The echinoderms collected are included in the catalogue published by the author in 1969. Bedford (1900) published an account of the echinoderms from Singapore and Malaca Straits.

The echinoderms of Mergui Archipelago are fairly well known through the publications of Bell (1886), Duncan (1887), Carpenter (1889), Sladen (1889) and Duncan and Sladen (1889). Rudmose Brown collected echinoderms from Mergui Archipelago and Lower Burma. Asteroids and echinoids from these places were described by Brown (1910) while the holothurians were described by Pearson (1910).

The echinoderms of the East Indian region which is perhaps the richest ground for echinoderms in the world is well known through the efforts of the Siboga Expedition. The holothurians by Sluiter (1901), echinoids by Meijere (1904), ophiuroids by Koehler (1904, 1905), crinoids by Döderlein (1907) and A. H. Clark (1912, 1918).
and asteroids by Döderlein (1917-1936) have been well reported. Engel (1933, 1938) 
has reported on the holothurians, asteroids and ophiuroids of the East Indian 
region.

Fisher (1934) reported a starfish from Christmas Island and A. H. Clark (1950) 
reported on some echinoderms from the Cocos-Keeling Islands. Bell (1884) has 
reported several echinoderms from the Indo-Pacific collected by H.M.S. Alert. 
A. H. Clark (1954) has listed a number of echinoderms occurring in the Indo-Pacific 
region.

The echinoderms occurring in the Western Australian region bordering the Indian 
Ocean have been well reported by H. L. Clark (1913-1946) in his several reports. 
Livingstone (1930-1934) recorded a few asteroids from the western Australian region, 
Marsh (1976) reported on the asteroids known since H. L. Clark.
