Abstract

We provide an updated checklist of fishes of the families Serranidae and Epinephelidae reported or listed from India, along with photographs. A total of 120 fishes in this group are listed as occurring in India based on published literature, of which 25 require further confirmation and validation. We confirm here the presence of at least 95 species in 22 genera occurring in Indian marine waters. The majority of the species belong to the grouper genus *Epinephelus* (41%), followed by *Pseudanthias* (15%) and *Cephalopholis* (13%). Most species (92%) found in India have been assessed globally either as Data Deficient (DD) or Least Concern (LC) on the IUCN Red List of Threatened Species. Since information on groupers from India is limited, there is an urgent need to document the diversity, ecology, life history, population status, and fisheries status of this group of fishes from the country.

Key words: ichthyology, tropical marine fishes, groupers, seabasses, Indian Ocean, Andamans, conservation, threatened, endangered species.

(2021) Checklist of serranid and epinephelid fishes (Perciformes: Serranidae & Epinephelidae) of India. *Journal of the Ocean Science Foundation*, 38, 35–65.

doi: <https://doi.org/10.5281/zenodo.5151903>

The percoid fishes of the families Serranidae and Epinephelidae, often called groupers, rock cods, seabasses, creolefish, coney, hinds, hamlets, anthias, and soapfishes, are a large group of predatory fishes, especially important in fisheries for food and sport, aquaculture, and the main predatory component of the ichthyofauna in undisturbed tropical marine ecosystems (Smith & Craig 2007, Craig et al. 2011, Ma et al. 2016, Ma & Craig 2018, Rimmer & Glamuzina 2019). The group consists of at least 597 species in 72 genera, occurring in all oceans, but most species are from tropical and subtropical waters (Parenti & Randall 2020, Fricke et al. 2021).

In India, serranids and epinephelids constitute a relatively minor component of the large mixed-species fisheries operating at a wide range of depths and habitats. Groupers especially form a minor but valuable component in the fishery and contributed around 51,433 tons (1.5% by weight) to the country's fisheries landings in 2018 (excluding Andaman and Nicobar Islands) (CMFRI 2019). The estimated annual grouper landings have been sharply increasing, from the range of 12,000 to 25,000 tons per annum from 1995–2010 (decadal average of ca. 13,000 tons from 1991–2000 vs. ca. 20,000 tons from 2001–2010) up to ca. 40,000 tonnes from 2011–2019 (<http://eprints.cmfri.org.in/>). The northern Arabian Sea coastal states, such as Gujarat, Karnataka, and Maharashtra, accounted for more than 60% of the estimated total of mainland grouper landings. The grouper fishery is dominated by the spinycheek grouper, *Epinephelus diacanthus* (Valenciennes, 1828). Other members of the group do not contribute to a large degree in the commercial trade, except in unusual circumstances (see Kishore et al. 2019) or in localized fisheries. We aim here to compile and update the list of serranid and epinephelid fishes occurring in India.

Our checklist was compiled based on observations made by the authors at multiple landing centers across India. The species list was updated and assessed after extensive review of published and grey literature and photographs and reports shared by colleagues, including divers along the coasts of India, and valid sources on social media. We cross-checked our assessments with recent reviews and databases: including Craig et al. (2011), Parenti & Randall (2020), Froese & Pauly (2021), and Fricke et al. (2021). The IUCN Red List assessment status for each species was retrieved from the IUCN Red List of Threatened Species™ (2019) and the species list was updated for the IUCN Grouper Fishery Monitoring and Assessment Workshop planned for Hong Kong, subsequently held online on May 10–11, 2020 due to the pandemic. AKV, BKK, and MM were invited and participated in the assessment workshop.

Along with many other fish groups, India's serranid and epinephelid diversity remains poorly known. The earliest detailed account of these fishes in India was provided by Russell (1803) which illustrated several groupers from Visakhapatnam (Bay of Bengal) classified under *Perca*, i.e. 'bontoo', 'madinawa bontoo', 'rahtee bontoo' and 'Sugualatoo bontoo' (see Russell (1803) plates 20–23). *Epinephelus marginalis* Bloch, 1793 was likely the first epinephelid described from Indian waters (type locality listed as East India); that species is now under the synonymy *Epinephelus fasciatus* (Forsskål, 1775). Since then, only 34 species have been described from India (up to 2020) (Table 1), compared to 72 species of serranids and epinephelids described globally between 2012 and 2021 alone (Fricke et al. 2021). The oldest known valid Indian species is the orange-spotted grouper *Epinephelus coioides* (Hamilton, 1822) described as *Bola coioides* from the Ganges River. The original description mentions it to be the same as the 'bontoo' of Russell (1803). Many early researchers contributed to the grouper diversity of India (Bloch & Schneider 1801, Shaw 1812, Hamilton 1822, Valenciennes 1828, 1830, Kner 1864, Bleeker 1875, Day 1868a, b, 1878, Alcock 1890).

Compilations of grouper species for the whole of India (Day 1888, Misra 1962, Talwar & Kacker 1984, James et al. 1996) are now outdated; and more recent publications focus on commercially important groupers (Basheer et al. 2017, Rajan et al. 2017) and are also limited to regional checklists (Jones & Kumaran 1980, James et al. 1996, Rajan 2002, Sluka & Lazarus 2010, Kandula et al. 2015). There is a lack of a comprehensive assessment of the overall diversity and distribution of serranids and epinephelids in India. Our assessment considers 120 species reported from India (see Appendix Table 3 and Appendix color plates), with 25 of them requiring additional confirmation due to unverifiable or doubtful listings, questionable images, and/or inadequate descriptions, and/or the records being outside of the currently known range of distribution, and/or pending confirmations (Craig et al. 2011). We anticipate the diversity of this group in India will prove to be higher than we have confirmed, due to potentially new species descriptions pending, new records from India, and some known species in the fishery requiring taxonomic appraisal and revalidation.

TABLE 1

Serranid & epinephelid species of fishes described from India

Species described from India	Current status	Type locality *
<i>Sciaena formosa</i> Shaw in Shaw & Nodder 1812	<i>Cephalopholis formosa</i> (Shaw 1812)	Visakhapatnam
<i>Serranus homfrayi</i> Day 1871	<i>Cephalopholis leopardus</i> (Lacepède 1801)	Port Blair, Andaman Islands
<i>Serranus somnerati</i> Val. in Cuvier & Valenciennes 1828	<i>Cephalopholis somnerati</i> (Valenciennes 1828)	Puducherry
<i>Centropristes investigatoris</i> Alcock 1890	<i>Chelidoperca investigatoris</i> (Alcock 1890)	Off Madras coast
<i>Chelidoperca maculicauda</i> Bineesh & Akhilesh 2013	<i>Chelidoperca maculicauda</i> Bineesh & Akhilesh, 2013	Off Quilon
<i>Serranus glaucus</i> Day 1871	<i>Epinephelus areolatus</i> (Forsskål 1775)	Andaman Islands
<i>Epinephelus dayi</i> Bleeker 1875	<i>Epinephelus bleekeri</i> (Vaillant 1878)	Madras
<i>Serranus coromandelicus</i> Day 1878	<i>Epinephelus bleekeri</i> (Vaillant 1878)	Madras
<i>Serranus dermochirius</i> Val. in Cuvier & Valenciennes 1830	<i>Epinephelus coeruleopunctatus</i> (Bloch 1790)	Coromandel coast
<i>Bola cooides</i> Hamilton 1822	<i>Epinephelus cooides</i> (Hamilton 1822)	Ganges River
<i>Serranus suillus</i> Val. in Cuvier & Valenciennes 1828	<i>Epinephelus cooides</i> (Hamilton 1822)	Coromandel coast, Puducherry, Visakhapatnam
<i>Epinephelus dayi</i> Bleeker 1874	<i>Epinephelus diacanthus</i> (Valenciennes 1828)	Cochin
<i>Serranus diacanthus</i> Val. in Cuvier & Valenciennes 1828	<i>Epinephelus diacanthus</i> (Valenciennes 1828)	Malabar
<i>Serranus erythrinus</i> Val. in Cuvier & Valenciennes 1828	<i>Epinephelus erythrinus</i> (Valenciennes 1828)	Malabar
<i>Epinephelus marginalis</i> Bloch 1793	<i>Epinephelus fasciatus</i> (Forsskål 1775)	East India
<i>Holocentrus marginatus</i> Shaw 1803	<i>Epinephelus fasciatus</i> (Forsskål 1775)	East India
<i>Serranus bontoo</i> Val. in Cuvier & Valenciennes 1828	<i>Epinephelus faveatus</i> (Valenciennes 1828)	Visakhapatnam & Madras
<i>Holocentrus caerulescens</i> Shaw 1803	<i>Epinephelus flavocaeruleus</i> (Lacepède 1802)	Indian seas

<i>Pseudanthias</i>	14	63
<i>Pseudogramma</i>	2	15
<i>Sacura</i>	1	5
<i>Variola</i>	2	2
total	95	357

A total of 95 species belonging to 22 genera were confirmed by our criteria to occur in Indian waters, accounting for 16% of the known serranids and epinephelids in the world (597). The diversity of genera is similar to that for the group from the entire Indo-Pacific region (Table 2). The genus *Epinephelus* is the most speciose, with 41% of total Indian species of this group, followed by *Pseudanthias* (15%) and *Cephalopholis* (13%) (Fig. 1).

The maximum species richness of this group documented in India occurs in Southern India and Andaman and Nicobar Islands. The lowest number of species was recorded for Lakshadweep, which could be a result of limited studies. In the northern part of the subcontinent, species diversity was low. The total was well higher than reported for neighboring countries including Pakistan (at least 24 species) and Myanmar (at least 50 species) (Psomadakis et al. 2015, 2019), likely due to India's large area of coastal waters and EEZ, diverse habitats, and broad latitudinal range.

Of the 95 species considered, 90 have been assessed in the global IUCN Red List with 9% categorized as Data Deficient (DD), 88% as Least Concern (LC), and 3% as Vulnerable (VU). In addition to these global assessments, there is an urgent need to undertake regional assessments, especially of the long-lived, highly exploited and clearly threatened species in Indian waters. Those groupers in the threatened category have a maximum reported size greater than 50 cm TL and include *Epinephelus polyphekadion* (Bleeker, 1849), *Epinephelus fuscoguttatus* (Forsskål, 1775) and *Plectropomus areolatus* (Ruppell, 1830) (Fig 2). The total of 92% of Indian species listed as DD or LC is similar to the global situation, where the majority of species are in these categories. In general, DD species are poorly documented, making it difficult to assess their true extinction risk (Sadovy et al. 2013, 2020).

In India, there is limited information on much of the marine fauna, including several exploited fish groups (Akhilesh et al. 2014, Tripathy & Mukhopadhyay 2015). Although groupers are a relatively small component of India's multi-species fishery, certain local grouper fisheries (Fig. 3) are significant (Advani et al. 2013), and the high rate of exploitation of juveniles in some species, like the Spinycheek grouper, are matters of conservation concern (Fig. 3D) (Dineshbabu & Radhakrishnan 2009). In the Andaman and Nicobar Islands, an export-oriented targeted fishery for reef fishes has developed (Advani et al. 2013) and high-intensity fishing in reef areas such as the Gulf of Mannar, Malvan, and a seasonal reef fishery in Lakshadweep region, are potential threats to these populations. With increased fishing effort, there is evidence of mean-length reduction in exploited fish populations (Akhilesh et al., in prep.). In the Indian groupers list, the largest species is *Epinephelus lanceolatus* (Bloch, 1790) with a

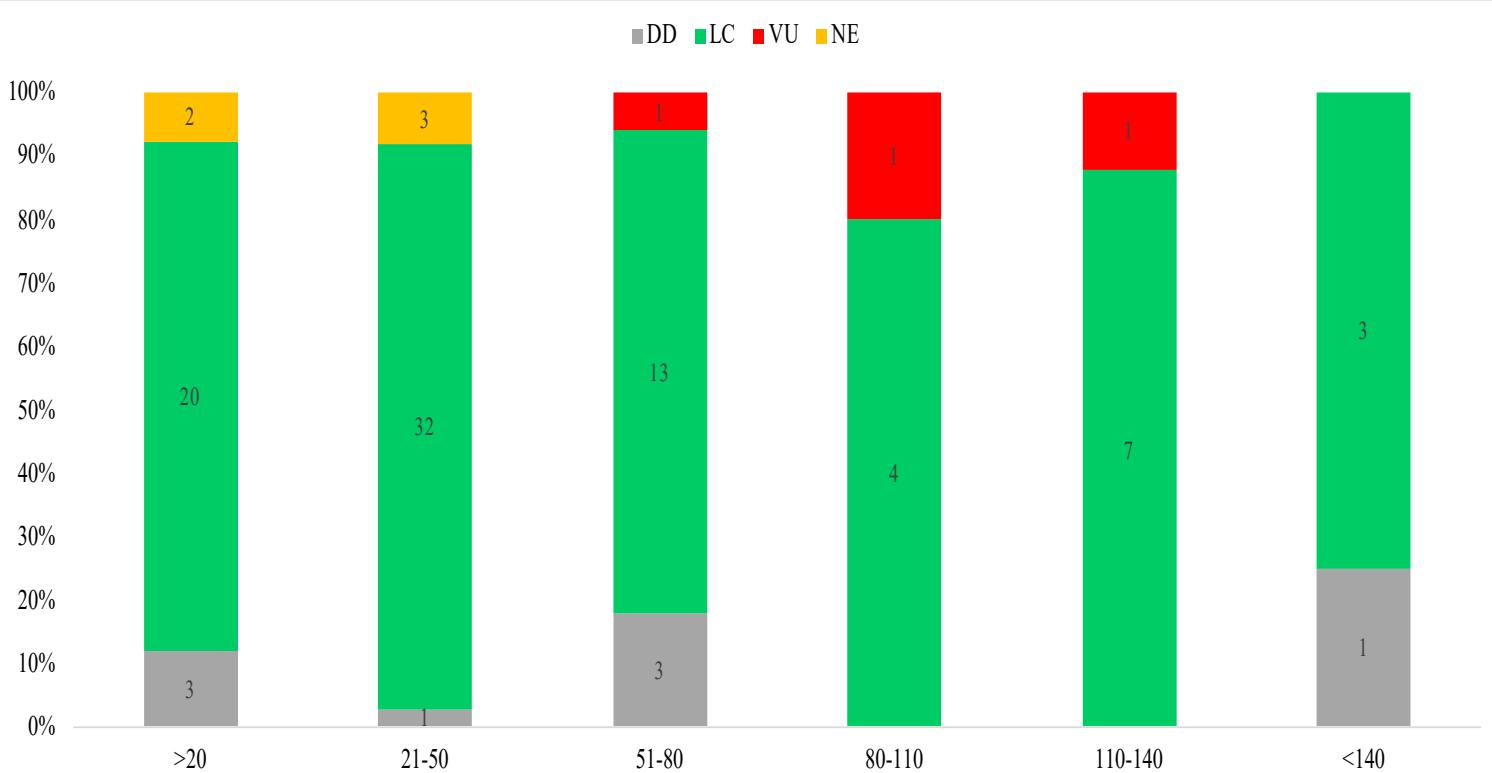

Figure 2. Proportion of serranid and epinephelid fishes in various IUCN Red List categories (93 species): DD= data deficient, LC= Least Concern, VU= Vulnerable.

Figure 3. Landings of groupers in India, A & B: Kerala; C: Andaman & Nicobar Islands; D: Maharashtra.

maximum reported size of 270 cm TL. The grouper fishery of India is dominated by medium-sized groupers with a maximum TL of 50 cm and even among these there is a predominance of juveniles. This exploitation of juveniles is a particular threat to many grouper species which have protogynous mating systems, potentially leading to population crashes. With increasing international and domestic demand for fish consumption, the exploitation of these fishes is likely to increase sharply, underscoring the urgent need for baseline assessments and intensive monitoring (Sadovy et al. 2020). The trade of the live reef fishes (including serranids) for the aquarium trade has received little attention, although this component is highly localized (Prakash et al. 2017). We recommend a regional and national status-assessment of serranids and epinephelids: it is likely many of the species currently assessed as DD or LC globally may fall in a higher threat category and lead to increased conservation efforts.

The giant grouper, *E. lanceolatus* is the only grouper being legally protected by inclusion in Schedule I (Part II A) of the Wildlife (Protection) Act 1972 of India since 2001. Globally the species has been assessed as DD by the IUCN Red List (Fennessy et al. 2018). Schedule I inclusion gives the species a highly protected status in India, similar to that for tigers and sawfishes.

In the Indian EEZ, there is a uniform fishing ban applicable to vessels (other than non-motorized) mostly from 15 April to 14 June for the east coast of India, and between 1 June to 31 July for the west coast. Coastal fisheries within 12 nm are managed by their respective coastal states. General fisheries-management measures like mesh-size regulation and fishing zones are also in place for different states under their Marine Fisheries Regulation Acts (MFRA). For example, the minimum legal size (MLS) for capture and trade of *E. diacanthus*, has been enacted by coastal states such as Kerala and Karnataka (at 18 cm TL). Besides these measures, community-based management and co-management measures are present in the Lakshadweep Islands, Andaman and Nicobar Islands, and Tamil Nadu (Sivadas & Godwin 2006, Jaini et al. 2018).

Marine faunal conservation in India has received very limited attention compared to terrestrial fauna. In addition, natural history collections in India give little attention to fishes, including serranids and epinephelids, and most fish species reported from India are not available in any single collection. Most of India's natural history collections, including fishes, are housed in the National Museum at Zoological Survey of India, Calcutta. The recent disasters, including the fire that destroyed the National Museum of Natural History (Delhi, India) in 2016 and the National Museum of Brazil in 2018 are a rationale to increase collections and promote dispersal of scientific materials across several institutions.

In summary, the effectiveness of management and conservation measures for serranid and epinephelid fishes in India is compromised by a general lack of species-specific information on key aspects of life history and population biology, fishery pressure, and poaching (e.g. Kirubasankar et al. 2019). Future efforts should be oriented towards critical information gathering, especially fishery monitoring, identification of breeding grounds and nursery areas, and, especially for groupers, potential spawning aggregations with the aim of implementing science-based conservation measures.

Acknowledgments

We thank Livi Wilson, Kishore, T.G., Swati Priyanka Sen, Tijo (ICAR-CMFRI), Anil Mohapatra (ZSI) Sileesh, M. (KUFOS), and Naveen, N. (Dakshin Foundation) for sharing information and images and Matthew Craig (NOAA), Rajeev Raghavan (KUFOS), and Yvonne Sadovy (The University of Hong Kong) for comments on the earlier version of manuscript. AKV, MM and KKB thank the IUCN and Bloom Foundation for the invitation to the IUCN Grouper Fishery Monitoring and Assessment Workshop. We thank The Biodiversity Heritage Library (BHL) for the open access collections. We thank the two anonymous reviewers whose comments have significantly improved the manuscript.
