component under the DOD-sponsored project entitled “Studies on marine mammals from the Indian EEZ and the contiguous seas”, is a significant step toward molecular inventorization of marine mammals in the larger interest of their conservation.

Table showing the particulars of molecular characterization of four cetacean species including their GenBank deposit numbers which can be accessed from the NCBI portal [http://www.ncbi.nlm.nih.gov/](http://www.ncbi.nlm.nih.gov/)

Large size bull sharks are caught by the gill nets regularly and the gillnet fishermen get good revenue. (*Madras Research Centre*)

**Damselfish bred at Mandapam Camp**

Broodstock development and breeding of the ornamental damselfish *Dascyllus aruanus* was achieved in captivity at Mandapam Regional Centre. (*Mandapam Regional Centre*)

**Unusual colouration of inshore waters at Mangalore**

During the last week of August, the inshore waters off Hejamadi, Kapu and Uchila at Mangalore appeared discoloured and foul smelling. Good fishery was reported for about three days from these places. Water samples and fishes were collected from these areas and analysed. Dissolved oxygen content in the samples was within the normal range and algal blooms were not observed. Fishes included sole, croakers, sandwhiting, sweetlips, flatheads, skates and rays. (*Mangalore Research Centre*)

**Loss of life at Mangalore**

At Mangalore sea was turbulent even after August, causing inconvenience to the local fishermen. Purseseines could not be operated on several days and the multi-night units too did not operate on regular basis. Sand bar formation at the channel entrance near Mangalore Fisheries Harbour made it very dangerous for the fishing boats to cross in and out of the channel. An accident at the channel caused 10 fishermen of the purse seine to fall out of their boat and only 6 of them could be rescued. (*Mangalore Research Centre*)

**Phytoplankton bloom off Azhikal coast (Quilon District, Kerala)**

A thick greenish yellow coloured bloom of diatoms Thalassiosira sp. and Coscinodiscus sp. was observed in the coastal waters between Azhikal and Arattupuzha in the Quilon district, which was badly hit by recent tsunami. The SST was 24.5°C at 14:45 h, indicating the presence of upwelled water. No mortality of finfish or shellfish noticed. Very high levels (17.37 µat/l) of silicate matched with the blooming of these two species of diatoms. Nitrate and phosphate levels were also quite higher than those in the adjacent non bloom areas, such as Thirikunnupuzha and Neendakara. (*Fishery Environment and Management Division*)

**Extensive damages to fishing crafts**

On the early hours of 7th September 2005, tidal waves inflicted damages to the anchored crafts in the fishing villages of Subbamanmapa, Ramsettipeta and Sooradipeta of Uppada hamlet in East Godavari district of AP. The cost of repairing damaged crafts was estimated at Rs. 2000-5000 per craft depending on the magnitude of the damage. (*Kakinada Research Centre*)

**Live Groupers transported for brood stock development**

Epinephelus malabaricus, (Malabar grouper) weighing 2 kg to 6.5 kg were transported live to Vizhinjam Research Centre of CMFRI in oxygenated containers without any mortality, from Karapad farm of Tuticorin Research Centre and Mandapam Regional Centre for brood stock development and breeding experiments. (*Vizhinjam Research Centre*)

**Orange clownfish *Amphiprion percula* bred at Vizhinjam**

Adult fishes of *Amphiprion percula* brought from Andamans were successfully bred and several batches of juveniles produced at Vizhinjam Research Centre. Incubation period for the attached eggs was 8 days. Hatching occurred at early hours of night between 7 and 8.30 PM. The larvae reached juvenile stage in two weeks and were transferred to grow-out tanks in 28-30 days. (*Vizhinjam Research Centre*)

**World record sized giant bull shark caught at Chennai coast**

A giant sized female bull shark *Carcharhinus leucas* measuring 356 cm in total length with a weight of 320 kg caught by a mechanized gillnet, was landed on 22-6-2005 at Kasimedu Fisheries Harbour, Chennai. The present record of bull shark *C. leucas* is the largest recorded from Indian Ocean as well as the largest bull shark ever recorded in the world. The shark was auctioned at the landing centre for Rs. 32,000/-. (*Vizhinjam Research Centre*)
