Demand and Supply Paradigms for Fish Food Security in India

Dr. Shyam. S. Salim*

Introduction

Fisheries has been recognized as a powerful income and employment generator as it stimulates growth of a number of subsidiary industries, and is a source of cheap and nutritious food besides being a foreign exchange earner. The present fish production is 9.3 million tonnes with a contribution of 3.93 million tonnes from marine sector and 5.46 million tonnes from inland sector. The fisheries contribution to GDP is 81400 crores contributing to around 0.82 per cent of the total GDP. The sector contributes around 7.3 per cent of the agriculture GDP. In terms of resources the country possesses a huge resource profile with an Exclusive Economic Zone of 2.02 million square km and a coastline of 8129 kms. In order to address the food security concerns of the country it is important to harness its fisheries resources.

The comprehensive development of agriculture, health, nutrition education, literacy, etc. would alone lead to enduring solution to the problem of food insecurity, poverty alleviations, unemployment and social tension in the region (Vijay and Shyam, 2001). There has been a gradual shift (as shown in Figure 1) in the production scenario from marine to inland fisheries in recent years. The contribution of the sector over the years from 1991 to 2010 is shown in Figure 1. In the figure it can be seen that marine sector contribution reduced from 58.86 per cent in 1991 to 38.84 per cent in 2010 whereas inland sector contribution increased from 41.14 per cent in 1991 to 61.16 per cent in 2011.(FAO, 2007,2005-13,) ,CMFRI (2012)

Food security challenges in India

The need for food security arises primarily due to the fluctuations in food plan and non-availability of sufficient food from domestic sources. In October 2011, population nearly tripled to seven billion people and by 2050, expected at 9 billion people. Due to

the increasing concerns of global warming and financial crisis, 'food' is becoming costlier every day. In order to feed this population, it is estimated that global food production will need to increase by 70% (The Guardian, 2012). In order to analyse the food fish requirement the demand and supply analysis was done and is given in Table 1.

It can be seen that the available supply from marine resources, inland resources, imports and that excluding exports/ Industrial/Processing purposes for the years 2015 will be 7.44 mt whereas the same forecasted for the years 2020, 2025 and 2030 is found 7.93, 8.45 and 9.10 mt respectively. If the population is assumed to be 1.28 billion in the year 2015, with 60% comprising a fish eating population and the per capita consumption be 12 kg, then the demand forecasted on the same year is found to be 9.22 mt (Table 2). Similarly, the population is assumed to be 1.36 billion (with 65% fish eaters and per capita consumption to be 12 kg), 1.45 billion (with 70% fish eaters and per capita consumption to be 12kg) and 1.53 billion (with 70% fish eaters and per capita consumption to be 12kg (as per ICMR Recommendations) for the years 2020, 2025 and 2030 respectively and thereafter the demand forecasted is calculated to be 10.61mt, 12.18mt and 12.85mt respectively through the above mentioned years. The demand-

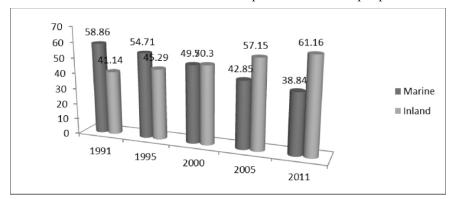

Figure 1: Sectoral contribution over the years

supply deficit for the years 2013, 2015, 2020, 2025 and 2030 is forecasted to be 1.70, 1.78, 2.67, 3.73 and 3.75 respectively.

Supply side

Table 1: Estimated Fish Supply **Analysis**

Sector*	Years						
Sector*	2013	2015	2020	2025	2030		
Marine	3.94	4.1	4.3	4.51	4.74

Demand –Supply gap (million tonnes)	1.70	1.78	2.67	3.73	3.75

[•]Value in billion rupees

Fish Food security challenges

The food security concerns in bridging the demand and supply of food fish depend upon the performance of the capture and culture sector. Among these the marine capture sector is grappled

increasing trend in landings would saturate at a level of 4.5 million tonnes as per the revalidation of the potential harvestable yield from the coastal waters of India.

The performance f the inland sector is expected to bridge the demand and supply gap. The growth of the inland sector especially the riverine, reservoir, estuarine fisheries never hold huge promises on account of low productivities in the sector. The present percentage utilization of brackish water resources is 18 per cent whereas for ponds and tanks the same is found to be 35 per cent. The huge untapped aquaculture field shows a great promise for meeting the food security of the country. Thus aquaculture sector appears to be the most important sector showing an impressive growth rate of around 6-8 per cent. The aquaculture sector includes fresh water aquaculture, brackish water aquaculture and capture based aquaculture (mariculture). However the sector contains numerous constraints and policy elements which are indicated in the following table (Table 3).

Sustainable Aquaculture

In the context of improving productivity and addressing food security concerns the environmental and biodiversity issues also needed to be considered. Sustainable aquaculture development is the management and conservation of aqua farming resources, and the orientation of technological and

institutional change in such a manner as to ensure the attainment and continued satisfaction of human needs for the present and future generations. Sustainable aquaculture aims at developing location specific, environment friendly, technically adept culture practices coupled with economically viable, culturally compatible, socially acceptable, ecologically sound, indigenous input driven culture technologies contribute to equitable development and ultimately sustainable development of aquaculture.

Achieving sustainability requires adhering to a full set of measures and cannot be reached through simply implementing one or two. Figure 4 depicting sustainable aquaculture is shown.
