Foreword

Since its establishment, the ICAR-Central Marine Fisheries Research Institute has held a singular position as India's principal scientific authority on marine fisheries, entrusted with the twin responsibility of advancing the frontiers of marine biological knowledge and translating that knowledge into instruments of national utility. Few instruments serve this dual purpose as quietly, or as fundamentally, as a code book of marine living resources, especially those encountered in commercial fisheries.

Marine capture fisheries in India draw upon an interesting yet challenging diversity of finfish, shellfish and other marine fauna landed across thousands of kilometres of coastline. To measure, monitor and manage this diversity meaningfully, science must first be able to name it precisely and consistently. Every stock assessment, every estimate of marine fish production, every biodiversity inventory, and every policy formulated in the interest of India's fisherfolk and the sustainability of the resource rests, ultimately, on the taxonomic bedrock that a publication of this kind provides. In this sense, the code book is not a peripheral or merely administrative document, it is one of the foundational instruments upon which the entire edifice of marine fisheries science and management in this country stands.

The Institute has borne this responsibility since it first published a code list of common marine living resources in 1983, and carried it forward through the revision of 2000. The present, thoroughly updated compilation reaffirms that legacy anew, in keeping with advances in taxonomic science and the changing profile of resources encountered along the Indian coast. That the Institute continues, over four decades on, to be the custodian of this reference speaks to the enduring trust reposed in it by fellow scientists, by policy makers, and by the fishing community whose livelihoods this science ultimately serves.

I take this opportunity to place on record my sincere appreciation for the staff of the Fishery Resources Assessment, Economics and Extension Division, especially its scientists and technical officials, and their colleagues across the Institute's biodiversity and resource-specific divisions, whose sustained and painstaking effort has brought this revision to fruition. Their work carries forward a legacy the Institute has upheld for over four decades and reaffirms ICAR-CMFRI's unique standing in marine fisheries research and its continuing service to the community and the nation.

Preface

The Central Marine Fisheries Research Institute (ICAR-CMFRI), Kochi, has served since its inception as the country's pioneer national establishment for marine fisheries research. As part of its continuing effort to disseminate scientific information, the Institute first published a code list of common marine living resources of Indian seas in 1983, and released a substantially revised version in December 2000, comprising 1608 entries (1023 identified to species level and 585 to genus level) arranged by Group, Subgroup, Family, Genus and Species.

In the years since, considerable advances have taken place in marine taxonomy, with many established genera, families and species undergoing revision, reclassification or synonymy. Alongside this, the range of resources routinely encountered in commercial marine fishing operations along the Indian coast has itself widened. It was felt necessary, therefore, to undertake a comprehensive revision of the code list, one that would not only correct and update nomenclature but also reorganise the entire scheme along strict taxonomic lines. The present code book is a result of this exercise.

The revised code book departs from the earlier Group-Subgroup arrangement and adopts a taxonomical hierarchy of Phylum, Class, Order, Family, Genus and Species, while retaining subgroup-level common names at the family level in addition to individual common names at the species level. It now covers a total of 2881 entries, comprising 1888 identified to species level and 993 to genus level, spanning 382 families, 121 orders, 24 classes and 9 phyla. Three subgroups make their first appearance in this edition, jellyfish, sea snakes and marine birds reflecting their growing relevance as bycatch and incidental-catch components of commercial fishing operations. Every species name has been individually verified against WoRMS, Fishbase and Sealifebase, and corrected wherever necessary at the level of phylum, class, order, family or genus. Each entry now additionally carries a unique 13-digit alphanumeric code, structured to encode phylum, class, order, family, genus and species in a fixed hierarchy, a system designed to be both intuitive and extensible.

This revision is the product of sustained and coordinated effort by researchers, especially scientific and technical staff of the Fishery Resources Assessment, Economics and Extension Division (FRAEED, formerly the Fishery Resources Assessment Division), working closely with scientific colleagues from the Marine Environment and Biodiversity Division (formerly the Marine Biodiversity Division), the Finfish Fisheries Division (formerly the Pelagic and Demersal Fisheries Division) and the Shellfish Fisheries Division (formerly the Crustacean and Molluscan Fisheries Division). Their collective expertise across capture fisheries, marine biodiversity and taxonomy has shaped this volume into far more than a code list.

It is expected that this code book will serve several purposes at once: as a ready repository of marine biodiversity information, as a working lexicon of the fin and shell fish resources commonly landed or encountered in Indian marine capture fisheries, and as the taxonomic backbone of any sound estimation of marine fish production. Its taxonomically grounded, uniquely coded structure is also intended to lend itself readily to future extension, including the tagging of resources for evolutionary and biodiversity assessment as the science develops.
